

**GENERAL DESCRIPTION**

CS8552 provides full conversion from digital video format YCbCr into NTSC/PAL composite and S-video. It can be used in VCD, DVD, digital VCR application.

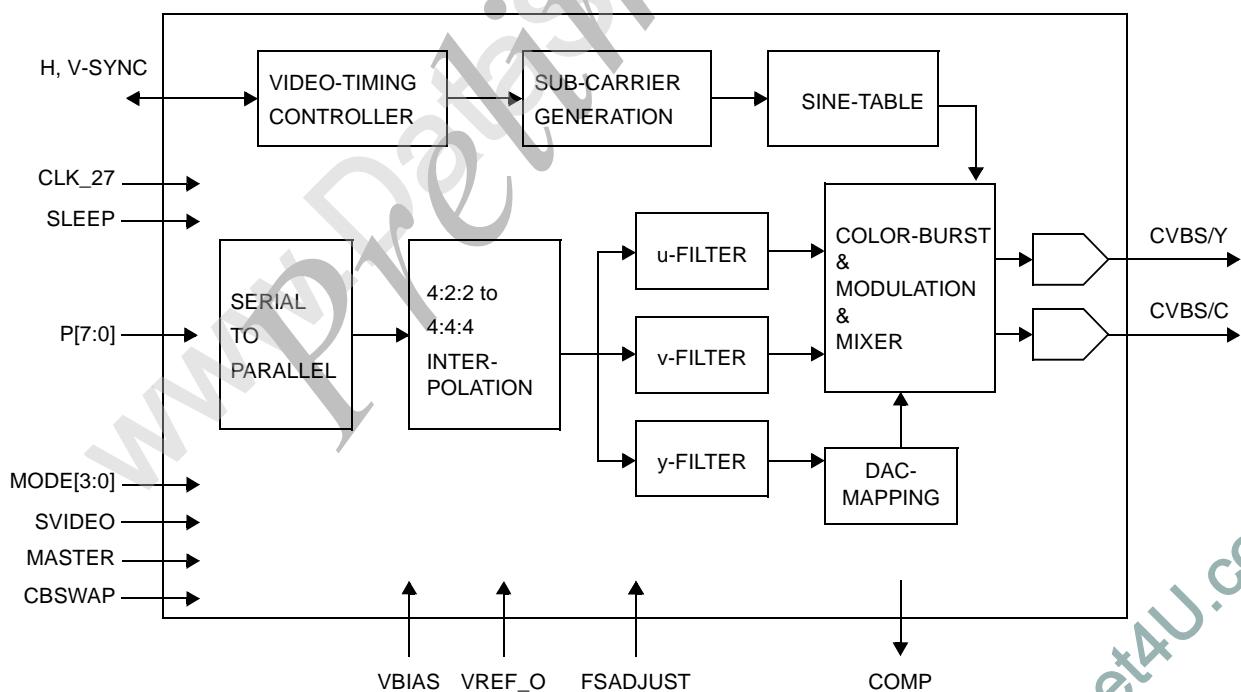

Two-times oversampling reduces the output filter requirements and guarantees no alias interference by internal UV filters and Y filter.

Two 9-bit DACs provides two channels for a S-video output port or two composite video outputs with high quality of image.

32-pin package and pin assignment make CS8552 compatible with major vendors.

FEATURES

- Designed special for VCD, Karaoke, digital VCR, DVD, DIGITAL set-top box.
- Support the following 4 modes: NTSC, PAL-M, PAL-BDGHI, PAL-Nc
- 8-bit 4:2:2 YcbCr inputs for glueless interface to MPEG decoders
- CVBS (composite YC) or S-video (Y and C) outputs
- Support CCIR-6-1 for mat, non-square pixel
- 2x oversampling simplify external filtering
- 6MHz and 1.3MHz anti-alias filters for Y and U/V channels each
- On-chip color bar generation
- 2 channels of 9-bit DAC
- Support master and slave modes
- Support interlace operation only
- Automatic mode detection/switching in slave mode
- 3.3V supply voltage; 5V tolerant for all digital I/O pins

PIN CONNECTION DIAGRAM

Figure-1 32-pin PLCC

**PIN DESCRIPTION**

| Name | I/O | Pin | Description |
|-------------|-----|-------|--|
| CLKI | I | 29 | Pixel clock, 27MHz, twice the Y sample rate |
| VSYNC | I/O | 32 | Vertical sync, output in master mode or input in slave mode, is synchronized by CLK. |
| HSYNC | I/O | 1 | Horizontal sync, output in master mode or input in slave mode, is synchronized by CLK too. |
| P[7:0] | I | 28-21 | YCbCr pixel inputs (TTL compatible). Also, synchronized by CLK with respect to the incoming HSYNC timing, the higher index corresponds to a greater significance. |
| MD[3:0] | I | 17-20 | Configuration inputs |
| MASTER | I | 16 | in 0: slave mode, h and v sync are inputs. 1: master mode, h and v sync are outputs. |
| CBSWAP | I | 15 | 0: normal Cr, Cb sequence. 1: swaps Cr, Cb sequence |
| SVIDEO | I | 14 | 0: composite output same signal on both Y, C channels, 1: s-video output, Y, C channels. |
| SLEEP | I | 13 | 1: power down, reset 0: normal operation |
| FSADJUST | I | 5 | Full scale adjust control pin. A resistor is connected to GND. Used to control the full-scale output current on analog outputs. |
| COMP | I | 6 | Compensation pin. A 0.1 μ F capacitor is used to bypass this pin to VCC. |
| VREFO | I | 8 | Voltage reference output, typically 1.2V, may be used to connect to VREFI input. |
| VREFI/VRDAC | I | 9 | Voltage reference input, typically 1.235V. A 0.11 μ F capacitor must be used to decouple this input to GND. DAC current switch reference input, connect to VREFO output. |
| VBIAS | O | 10 | DAC bias voltage, 0.7 v less than COMP signal |
| CVBS/C | O | 11 | Composite output or chrominance |
| CVBS/Y | O | 4 | Composite output or luminance (with blanking and sync) |
| VAA | | 7 | Analog power |
| VDD | | 31 | Digital power |
| GND | | 30 | Digital ground |
| AGND | | 3, 12 | Analog ground |
| NC | | 2 | No connection |

FUNCTIONAL DESCRIPTION

MODE configuration

See **Table 1** to **Table 3** for details.

master = 1: master mode

horizontal sync and vertical sync are generated from internal timing and are output at the rising edge of clk_27.

md[3]: define EFIELD function

0: vsync is output pin

1: vsync is even/odd field indicator, vsync=0 even, vsync=1 odd.

md[2]: define PAL625 function

0: 525 line operation is set.

1: 626 line operation is set.

master = 0: slave mode

Horizontal sync and vertical sync are inputs that are synchronized by clk_27.

A falling edge of VSYNC* occurring within $\pm 1/4$ of a scan line from the falling edge of HSYNC* cycle time indicates the beginning of Field-1. A falling edge of VSYNC* occurring within $\pm 1/4$ of a scan line from the middle point of the line indicates the beginning of Field-2. See **Figure 2**

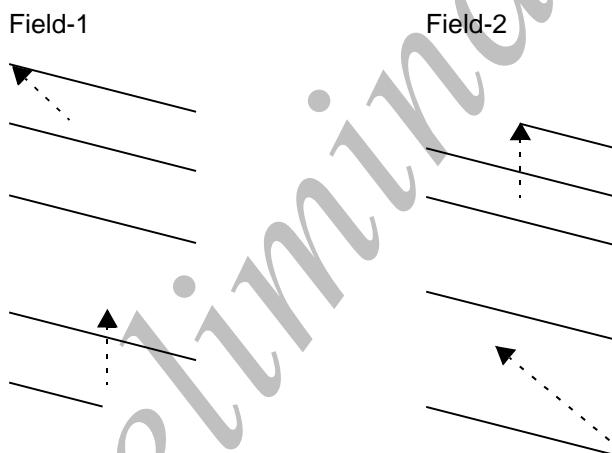

Figure-2

md[3]: define YCSWAP

0: normal operation.

1: Swap the luma and chroma samples.

md[2]: define SETUP function

0: 7.5 IRE setup is enabled for NTSC and PAL-M, with scaling for 92.5% black-to-white range, other PALs with normal 100% black-to-white range.

1: 7.5 IRE setup is disabled for NTSC and PAL-M, with scaling for 100% black-to-white range.

md[1]: define PALSA function, South America.

0: Normal operation.

1: PAL-M used for Brazil 525 lines operation. PAL-Nc used for Argentina 625 lines operation.

Table-1

| Mode | Mode[3] | Mode[2] | Mode[1] | Mode[0] |
|-------------|----------------|----------------|----------------|----------------|
| Slave | YCSWAP | SETUP | PALSA | RESERVED |
| Master | EFIELD | PAL625 | RESERVED | RESERVED |

| | |
|--------|---|
| EFIELD | EFIELD is used when configured as a master. When EFIELD is set low, the Normal vsync* signal is output on the VSYNC* pin. When EFIELD is set high, field ID information is output on the VSYNC* pin (VSYNC* low for Field-1 and high for Field-2) |
| PAL625 | PAL625 is used when configured as a master. When PAL625 is set low, 525-line operation is selected. When PAL625 is set high, 625-line operation is selected. This mode is set by automatic detection when configured as a slave. |
| YCSWAP | YCSWAP should normally be set to zero. When configured as a slave, this bit can be set high to swap the luma and chroma samples, thus altering the pixel sequence with respect to the incoming HSYNC* timing reference. |
| SETUP | SETUP is normally low for the common video modes. The setup and scaling function is toggled when this bit is high. When SETUP is low, the 7.5IRE setup is enabled for NTSC and PAL-M with scaling amplified for a 92.5% black-to-white range; other PAL formats have setup disabled with normal 100% scaling. When SETUP is high, the 7.5 IRE setup is disabled for NTSC and PAL-M with 100% black-to-white range scaling; other PAL formats have setup enabled with amplified scaling. |
| PALSA | PALSA is normally low for the common video modes. South American video Standards can be enabled by setting this bit high. For 525-line operation, the PALSA enables PAL-M for Brazil; in 625-line operation, the PALSA enables PAL-Nc for Argentina. |

Table-2 Master mode:

| master | Mode[3:0] | System | PAL-625 | PALSA | Fv Hz | Fh Hz |
|---------------|------------------|------------------------|----------------|--------------|--------------|--------------|
| 1 | X000 X010 | (Normal setup) NTSC | 0 | 0 | 59.94 | 15734.26 |
| 1 | X000 X010 | PAL-M | 0 | 1 | 59.94 | 15734.26 |
| 1 | X000 X110 | PAL-BDGHI | 1 | 0 | 50.00 | 15625 |
| ↑ 1 | X010 X110 | PAL-Nc | 1 | 1 | 50.00 | 15625 |

Table-3 Slave mode:

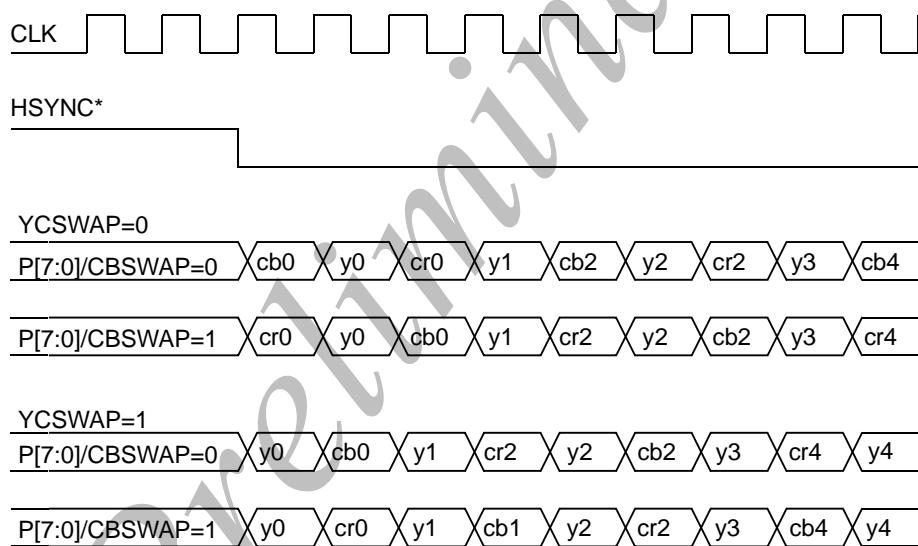

| Master | Mode[3:0] | System | PAL-625 | PALSA | Fv hz | Fh Hz |
|---------------|------------------|---------------|----------------|--------------|--------------|--------------|
| 0 | X000 | NTSC | 0 | 0 | 59.94 | 15734.26 |
| 0 | X010 | PAL-M | 0 | 1 | 59.94 | 15734.26 |
| 0 | X000 | PAL-BDGHI | 1 | 0 | 50.00 | 15625 |
| 0 | X010 | PAL-Nc | 1 | 1 | 50.00 | 15625 |

**PIXEL INPUT/OUTPUT TIMING**

1. clk is 2x the luminance sampling rate (13.5 MHz) or 4x the chrominance sampling rate (6.75 MHz), all signals are reference to rising edge.
2. In accordance with CCIR656, the input pixel pattern begins during the first clk period after the falling edge of HSYNC (same for master mode and slave mode). The input pattern is Cb0, Y0, Cr0, Y1, Cb2, Y2, Cr2, Y3,..... The input pin CBSWAP and md[3] (YCSWAP) could be used to swap cb, cr sequence and also y and cb, cr sequence. See **Figure 3**.
3. Pixel input range: See **Table 4**
Y: 16-235 for normal range; 0-15, 236-255 are invalid. When Y value is between 0-15 then clamp to 16, when 236 and 255 Y will be set to 255.
CbCr: 16-240 for normal range with 128 mapped to 0; 0-15, 241-255 are invalid. When Cb/Cr is between 0-15 will be clamp to 16, when Cb/Cr is 241 to 255 then will be set to 240.

Table-4 75% amplitude, 100% saturated YCbCr color bars

| element | range | White | Yellow | Cyan | Green | Magenta | Red | Blue | black |
|---------|--------|-------|--------|------|-------|---------|-----|------|-------|
| Y | 16-235 | 235 | 162 | 131 | 112 | 84 | 65 | 35 | 16 |
| Cb | 16-240 | 128 | 44 | 156 | 72 | 184 | 100 | 212 | 128 |
| Cr | 16-240 | 128 | 142 | 44 | 58 | 198 | 212 | 114 | 128 |

**Figure-3**

VIDEO TIMING

See Table 5, Table 6

1. If master mode is selected, horizontal counter is incremented on clk/2, and reset to 1 when h-total is hit. The output hsync is 6 clk later than the internal horizontal sync. Vertical counter is incremented by every horizontal scan line and reset to 1 after v-total hit. The output vertical sync is 3 or 2.5 lines for 262/525 and 312/625 later.
2. If slave mode is selected, the horizontal counter is incremented on the rising of clk and then reset to 1 after 2 clk cycles late of falling edge of hsync. The vertical counter is incremented on the falling edge of hsync and reset to 1 at falling edge of vertical sync. If the falling edge of vertical sync occurring within [-1/4, 1/4] of a scan line from the falling edge of hsync indicates the even field, if within [-1/4, 1/4] of middle point of scan line indicates odd field.
3. The width of horizontal sync and the start and end of color burst is automatically calculated and inserted for each mode.
4. sync timing and burst envelopes are internally controlled. Color burst frequency is derived from the clk. Any jitter on clk may induce a color burst frequency error.
5. timing tables:

Table-5 Vertical timing table

| System | Odd-field Non-active | Odd-field Active | Even-field Non-active | Even-field Active | Total size | Active size |
|-----------|-----------------------|------------------|--|-------------------|------------|-------------|
| NTSC | Line 1-22 VBI=7-21 | Line 23-262 | Line 263-284; 525 VBI=270-284 | Line 285-524 | 858*525 | 720*480 |
| PAL-BD°K. | Line 1-22 VBI=7-21 | Line 23-310 | Line 311-335; 624, 625 VBI=319-333 | Line 336-623 | 864*625 | 720*576 |

Table-6 Horizontal timing table: number of 13.5 MHz cycles

| System | Front-porch | Back-porch | Active | Burst-start | Burst-width | total |
|----------|-------------|------------|--------|-------------|-------------|-------|
| NTSC | 20 | 127(122) | 711 | 72 | 34 | 858 |
| PAL-M | 20 | 127 | 711 | 78 | 34 | 858 |
| PAL-BD.. | 20 | 142(132) | 702 | 76 | 30 | 864 |
| PAL-Nc | 20 | 142 | 702 | 76 | 34 | 864 |

6. Color burst is disabled on appropriate scan lines. Serration and equalization pulses are generated on appropriate scan lines. For NTSC, color burst information is automatically disabled on scan line 1-9 and 264-272 or PAL-M, color burst information is automatically disabled on scan line 1-11 and 263-273. For PAL-BDGHINc, color burst information is automatically disabled on scan line 1-6 and 310-318 and 623-625 for field 1,2,5,6. However, for field 3,4,7,8 burst is disabled at scan line 1-5,311-319,622-625. See the following **Figure 4**, **Figure 5** and **Figure 6**.

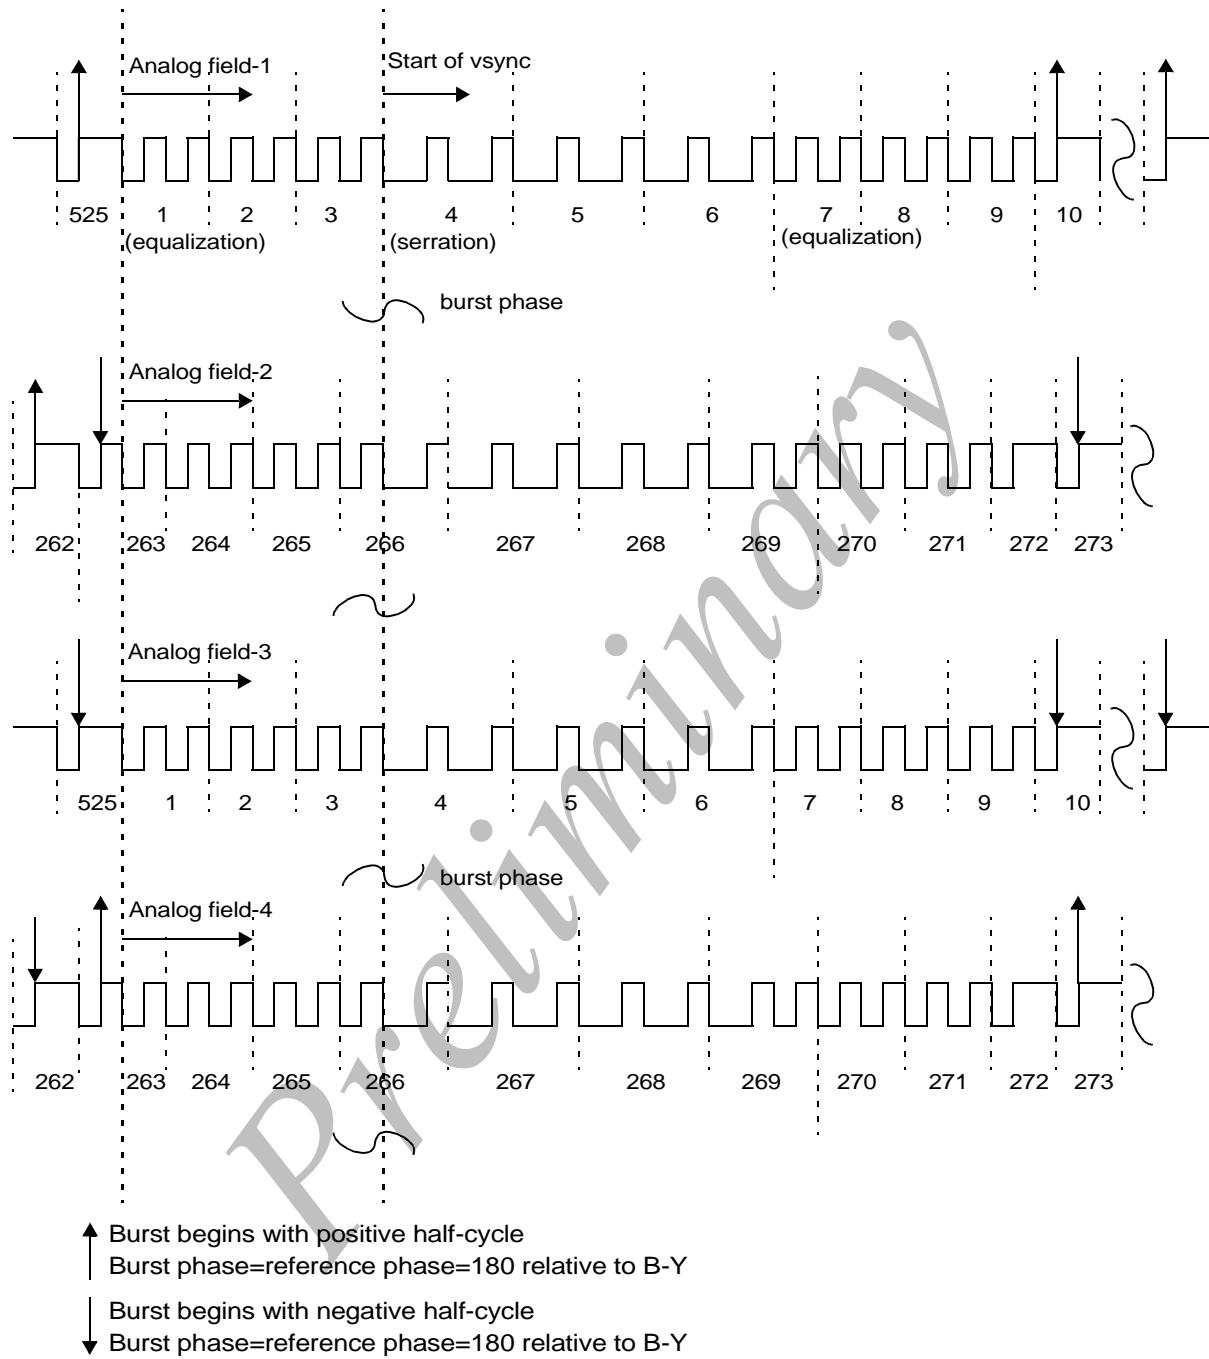

Figure-4 Interface 525-line (NTSC) video timing

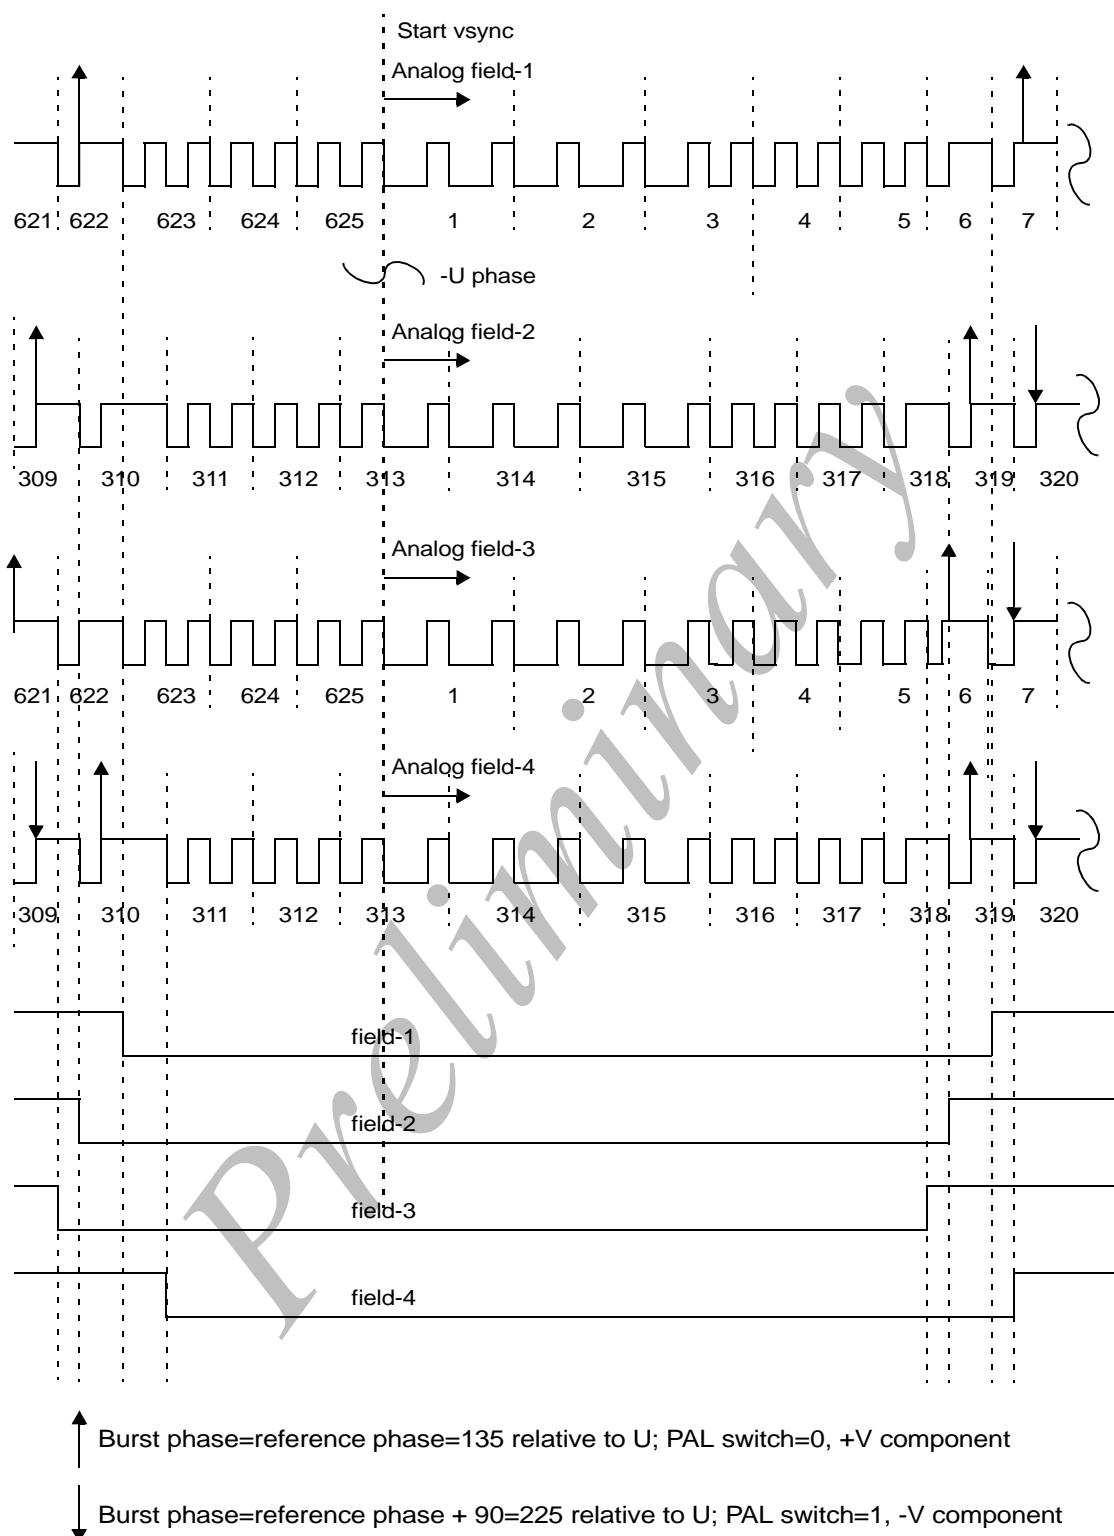

Figure-5 Interface 625-line (PAL-B,D,G,H,I,N,Nc) video timing

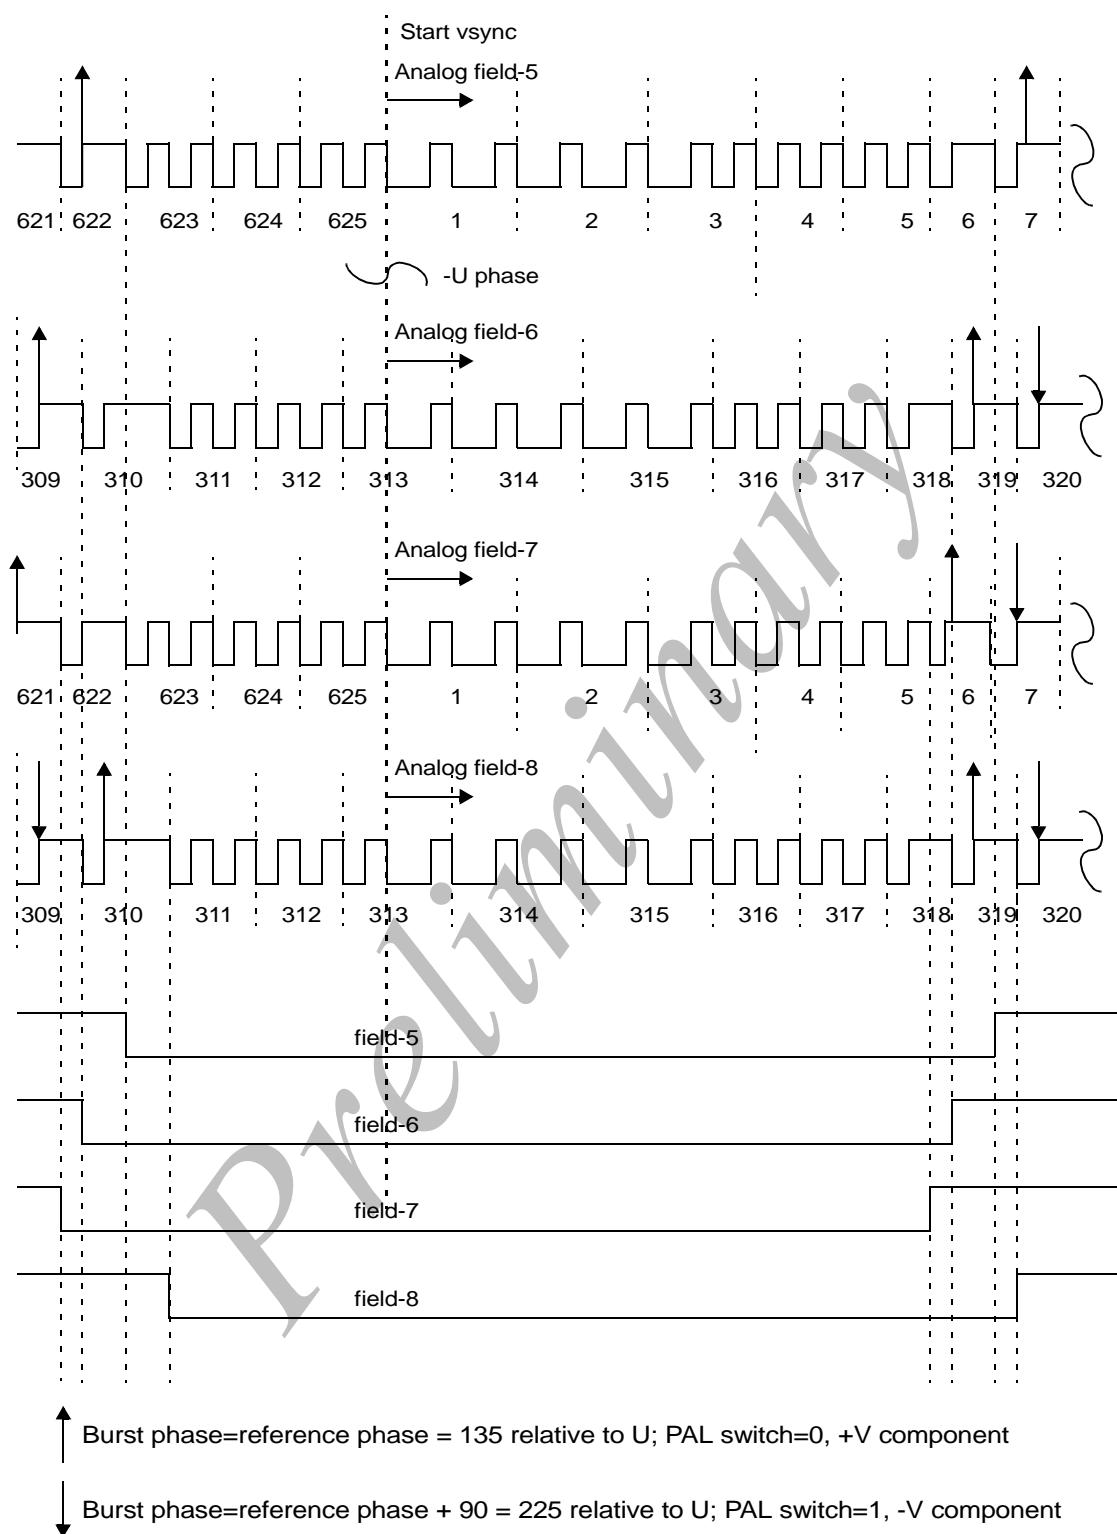

Figure-6

**ANTI-ALIAS FILTERS CHARACTERIS**

The Y and the U, V are up-samples to clk, 27MHz after 4:2:2 to 4:4:4 conversion. Y is filtered by a filter whose passband is 6MHz. And U, V are also filtered by passband = 1.3MHz filters.

Please refer to **Figure 7** to **Figure 10**

DAC MAPPING

Depends on the video output mode, the color bars mapping to DAC are specified in **Table 7** to **Table 12** and **Figure 11** to **Figure 16**. Where white is 400. For PAL-BDGHINc blank = 120. For NTSC/PAL-M blank = 114 (setup = 0), 1 IRE = 2.857; if setup = 1, blank = 112, 1 IRE = 2.8.

Table-7 s-video Y NTSC/PAL-M 525, setup = 0

| Description | DAC data | Sync interval |
|-------------|----------|---------------|
| White | 400 | 0 |
| Black | 136 | 0 |
| Blank | 114 | 0 |
| Sync | 0 | 1 |
