

## Features

- Low Power Consumption: 1.5μA (Typ)
- Maximum Output Current: 150mA
- Small Dropout Voltage  
300mV@100mA (Vout=3.3V)
- High Input Voltage: Up to 36V
- High Accurate:  
CST7550(B)±2% Output Voltage  
CST7550(A)±1% Output Voltage
- RoHS Compliant and Lead (Pb) Free
- Good Transient Response
- Integrated Short-Circuit Protection
- Over-Temperature Protection
- Output Current Limit
- Stable with Ceramic Capacitor
- Support Fixed Output Voltage  
1.8,2.5,3.0,3.3,3.6,4.0,4.2 and 5.0V
- Available Package  
SOT23-3 \ SOT89-3

## Application

- Portable, Battery Powered Equipment
- Battery-powered equipment
- Weighting Scales
- Smoke detector and sensor
- Audio/Video Equipment
- Home Automation

## Description

The CST7550 series is a high voltage, ultralow-power, low dropout voltage regulator. The device can deliver 150mA output current with a dropout voltage of 300mV and allows an input voltage as high as 36V. The typical quiescent current is only 1.5μA. The device is available in fixed output voltages of 1.8, 2.5, 2.8, 3.0, 3.3, 3.6, 4.0, 4.2, 4.4 and 5.0V. The device features integrated short-circuit and thermal shutdown protection. Although designed primarily as fixed voltage regulators, the device can be used with external components to obtain variable voltages.

## Application Circuits

36V;1.5μA IQ,150mA Low-Dropout Linear Voltage Regulator

**Pin Configuration****Pin Description**

Storage Temperature		T <sub>STG</sub>	-40~125	°C
Soldering Temperature & Time		T <sub>SOLDER</sub>	260°C, 10s	

Note (1): Exceeding these ratings may damage the device.

Note (2): The device is not guaranteed to function outside of its operating conditions

Note (3): The package thermal impedance is calculated in accordance to JESD 51-7.

**ESD Ratings**

Item	Description	Value	Unit
V <sub>(ESD-HBM)</sub>	Human Body Model (HBM) ANSI/ESDA/JEDEC JS-001-2014 Classification, Class: 2	±4000	V
V <sub>(ESD-CDM)</sub>	Charged Device Model (CDM) ANSI/ESDA/JEDEC JS-002-2014 Classification, Class: C0b	±100	V
I <sub>LATCH-UP</sub>	JEDEC STANDARD NO.78E APRIL 2016 Temperature Classification, Class: I	±150	mA

ESD testing is performed according to the respective JESD22 JEDEC standard. The human body model is a 100 pF capacitor discharged through a 1.5kΩ resistor into each pin. The machine model is a 200pF capacitor discharged directly into each pin.

**Recommended Operating Conditions**

Parameter	MIN.	MAX.	Units
Supply voltage at V <sub>IN</sub>	3.0	24	V
Operating junction temperature range, T <sub>j</sub>	-40	125	°C
Operating free air temperature range, T <sub>A</sub>	-40	85	°C

Note : All limits specified at room temperature (T<sub>A</sub> = 25°C) unless otherwise specified. All room temperature limits are 100% production tested. All limits at temperature extremes are ensured through correlation using standard Statistical Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).

## Function Block Diagram

## Application Guideline

### Input Capacitor

A 10 $\mu$ F ceramic capacitor is recommended to connect between V<sub>DD</sub> and GND pins to decouple input power supply glitch and noise. The amount of the capacitance may be increased without limit. This input capacitor must be located as close as possible to the device to assure input stability and less noise. For PCB layout, a wide copper trace is required for both VIN and GND.

### Output Capacitor

An output capacitor is required for the stability of the LDO. The recommended output capacitance is 10 $\mu$ F, ceramic capacitor is recommended, and temperature characteristics are X7R or X5R. Higher capacitance values help to improve load/line transient response. The output capacitance may be increased to keep low undershoot/overshoot. Place output capacitor as close as possible to VOUT and GND pins.

### Dropout Voltage

The dropout voltage refers to the voltage difference between the VIN and VOUT pins while operating at specific output current. The dropout voltage V<sub>DROP</sub> also can be expressed as the voltage drop on the pass-FET at specific output current (I<sub>RATED</sub>) while the pass-FET is fully operating at ohmic region and the pass-FET can be characterized as an resistance R<sub>DS(ON)</sub>. Thus the dropout voltage can be defined as ( $V_{DROP} = VIN - VOUT = R_{DS(ON)} \times I_{RATED}$ ). For normal operation, the

36V·1.5 $\mu$ A IQ, 150mA Low-Dropout Linear Voltage Regulator  
suggested LDO operating range is ( $V_{IN} > V_{OUT} + V_{DROP}$ ) for good transient response and PSRR  
ability. Vice versa, while operating at the ohmic region will degrade the performance severely.

### Thermal Application

For continuous operation, do not exceed the absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated as below:  $T_A=25^{\circ}\text{C}$ , PCB,

$$\text{The max PD} = (125^{\circ}\text{C} - 25^{\circ}\text{C}) / (\text{Thermal Resistance } ^{\circ}\text{C/W})$$

Power dissipation (PD) is equal to the product of the output current and the voltage drop across the output pass element, as shown in the equation below:

$$PD = (V_{IN} - V_{OUT}) \times I_{OUT}$$

### Layout Consideration

By placing input and output capacitors on the same side of the PCB as the LDO, and placing them as close as is practical to the package can achieve the best performance. The ground connections for input and output capacitors must be back to the CST7550 ground pin using as wide and short of a copper trace as is practical. Connections using long trace lengths, narrow trace widths, and/or connections through via must be avoided. These add parasitic inductances and resistance that results in worse performance especially during transient conditions.
