

200mA Low-Dropout Linear voltage regulator

CST9001 Features

- Low Power Consumption: 1.0uA (Typ)
- Maximum Output Current: 200mA
- Small Dropout Voltage
 - 150mV@100mA (Vout=3.3V)
 - 240mV@100mA (Vout=1.8V)
- Input Voltage Range: 1.5V~6.5V
- Output Voltage Range: 0.9V~5.0V
(customized on command in 0.1V steps)
- RoHS Compliant and Lead (Pb) Free
- High Accurate: ±2%
(±1% customized)
- Output Current Limit
- Integrated Short-Circuit Protection
- Good Transient Response
- Stable with Ceramic Capacitor
- Available Package:
 - SOT23、SOT23-3L
(customized DFN1x1、SOT89-3L)

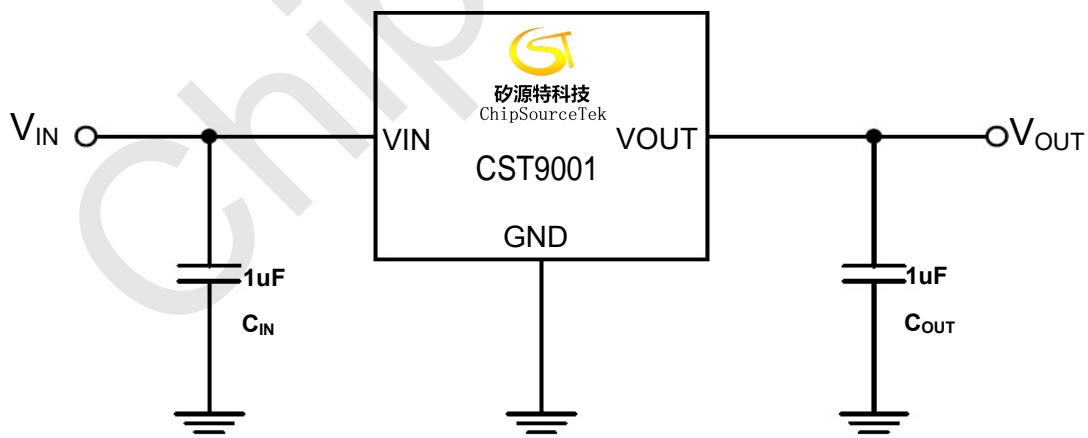

CST9001 Application

- Battery Powered equipment
- Reference Voltage Source
- Power Management of MP3, PDA.....
- Weighting Scales

CST9001 Description

CST9001 series is a group of positive voltage output, low power consumption, low dropout voltage, Linear voltage regulator. It can provide 100mA output current when input / output voltage differential dropsto 150mV (Vout=3.3V) , The very low power consumption of CST9001 (Iq=1.0uA) can greatly improve natural life of batteries.CST9001 can provide output value in the range of 0.9V~5.0V in 0.1V steps. It also can customized on command.CST9001 includes high accuracy voltage reference, error amplifier, current limit circuit and output driver module.CST9001 has well load transient response and good temperature characteristic, And it uses trimming technique to guarantee output voltage accuracy within±2%.

CST9001 Application Guideline

Input Capacitor

A $1\mu F$ ceramic capacitor is recommended to connect between V_{DD} and GND pins to decouple input power supply glitch and noise. The amount of the capacitance may be increased without limit. This input capacitor must be located as close as possible to the device to assure input stability and less noise. For PCB layout, a wide copper trace is required for both VIN and GND.

Output Capacitor

An output capacitor is required for the stability of the LDO. The recommended output capacitance is $1\mu F$, ceramic capacitor is recommended, and temperature characteristics are X7R or X5R. Higher capacitance values help to improve load/line transient response. The output capacitance may be increased to keep low undershoot/overshoot. Place output capacitor as close as possible to VOUT and GND pins.

Dropout Voltage

The dropout voltage refers to the voltage difference between the VIN and VOUT pins while operating at specific output current. The dropout voltage $VDROP$ also can be expressed as the voltage drop on the pass-FET at specific output current (IRATED) while the pass-FET is fully operating at ohmic region and the pass-FET can be characterized as an resistance $RDS(ON)$. Thus the dropout voltage

200mA Low-Dropout Linear voltage regulator

can be defined as ($V_{DROP} = VIN - VOUT = RDS(ON) \times I_{RATED}$). For normal operation, the suggested LDO operating range is ($VIN > VOUT + V_{DROP}$) for good transient response and PSRR ability. Vice versa, while operating at the ohmic region will degrade the performance severely.

Thermal Application

For continuous operation, do not exceed the absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated as below: $TA=25^{\circ}\text{C}$, PCB,

$$\text{The max PD} = (125^{\circ}\text{C} - 25^{\circ}\text{C}) / (\text{Thermal Resistance } ^{\circ}\text{C/W})$$

Power dissipation (PD) is equal to the product of the output current and the voltage drop across the output pass element, as shown in the equation below:

$$PD = (VIN - VOUT) \times I_{OUT}$$

Layout Consideration

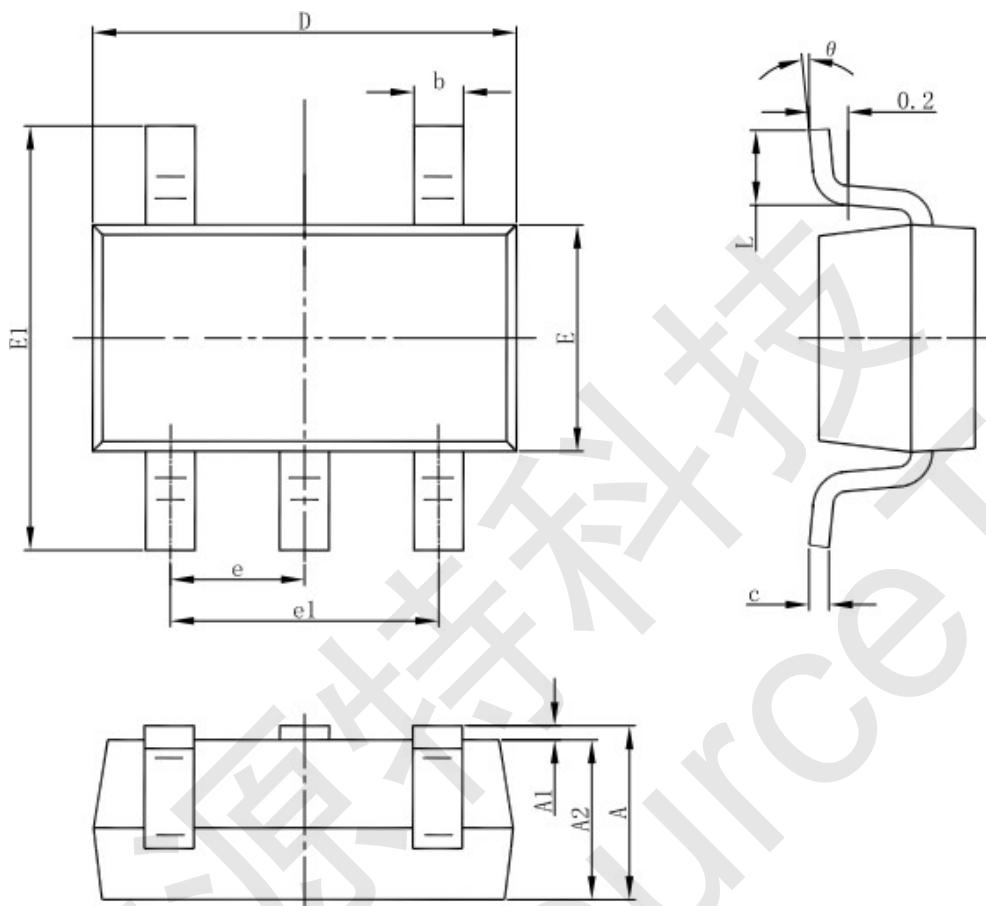

By placing input and output capacitors on the same side of the PCB as the LDO, and placing them as close as is practical to the package can achieve the best performance. The ground connections for input and output capacitors must be back to the CST9001 ground pin using as wide and as short of a copper trace as is practical. Connections using long trace lengths, narrow trace widths, and/or connections through via must be avoided. These add parasitic inductances and resistance that results in worse performance especially during transient conditions.
