

### CVA3424A / CVA3424

#### FEATURES

- Bandwidth ..... 185MHz
- Rise/Fall Time..... 2.5ns
- Swing ..... 40V<sub>P-P</sub>
- Supply Voltage..... 80V

#### APPLICATIONS

- CRT Driver for 2000 x 1600, 1600 x 1280 and 1280 x 1024 Monitors

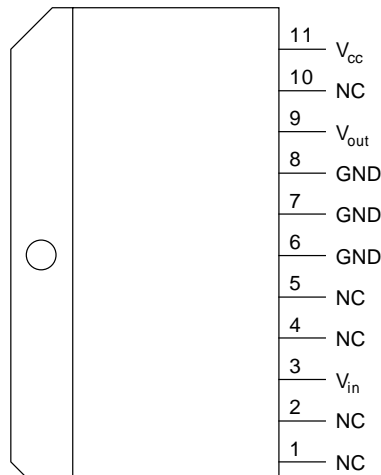

#### DESCRIPTION

The CVA3424 Family is a video driver amplifier designed specially to drive high resolution color monitors. With rise and fall time of under 2.5ns and 185MHz bandwidth, this device will provide excellent drive capability for the 2000 x 1600, 1600 x 1280 and 1280 x 1024 monitors.

#### ORDERING INFORMATION

Part	Package	Temperature
CVA3424AT	TO-220	-20°C to +90°C
CVA3424T	TO-220	-20°C to +90°C

#### CONNECTION DIAGRAM AND SIMPLIFIED SCHEMATIC

PIN 1 DESIGNATOR

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage . . . . . 85V      Operating Temperature . . . . . -20°C to +90°C  
 Storage Temperature . . . . . -25°C to +100°C      Lead Temperature . . . . . +300°C

**DC ELECTRICAL CHARACTERISTICS**  $V_S = 80V$ ,  $C_L = 10pF$ ,  $V_{out} = 40V_{p-p}$ . See Figure 1.  $T_A = +125^\circ C$  unless otherwise noted.

SYMBOL	CHARACTERISTICS	MIN	TYP	MAX	UNITS
$I_{CC}$	Supply Current		45	55	mA
$V_{inDC}$	$I_{put}$ DC Level	1.4	1.6	1.8	V
$V_{outDC}$	Output DC Level	34	40	46	V
$A_v$	Voltage Gain	11	13	15	V
	Gain Matching		0.2		dB

**AC ELECTRICAL CHARACTERISTICS**  $V_S = 80V$ ,  $C_L = 10pF$ ,  $V_{out} = 40V_{p-p}$ . See Figure 1.  $T_A = +125^\circ C$  unless otherwise noted.

SYMBOL	CHARACTERISTICS	CVA3424A			CVA3424			UNITS
		MIN	TYP	MAX	MIN	TYP	MAX	
$t_r$	Rise Time		2.2	2.9		2.5	3.5	ns
$t_f$	Fall Time		2.5	2.9		2.7	3.5	ns
BW	Bandwidth		185			150		MHz
$Le$	Linearity		5			5		%
OS / US	Overshoot / Undershoot		8			8		%

**FIGURE 1. TEST CIRCUIT**

R1 = 270  $\Omega$   
 R2 = 12k  $\Omega$  (1 W)  
 R4 = 300k  $\Omega$   
 R5 = 15  $\Omega$   
 R6 = 15  $\Omega$

C2 = Variable 4 to 150pF  
 Typical 27pF  
 C3 = 46pF  
 C4 = 10  $\mu F$ /160V

C6 = 0.01  $\mu F$ /160V  
 $C_L$  = 10pF (Including Parasitics)

D1 = DS464  
 D2 = DS464  
 L1 = 150nH

**APPLICATIONS INFORMATION**

**Basic Circuit Configuration**

The CVA3424 is a transimpedance amplifier with two stage feedback amplifier configurations. Any change in input current will be reflected as change in output voltage swing. A resistor in series with the input will change the CVA3424 into a voltage amplifier. The output is an emitter follower. Because of the complementary circuitry employed, there is no need for load or pull up resistor.

An internally bypassed capacitor is included inside the package, however, for low frequencies an electrolytic capacitor is recommended.

CVA3424 has an internal feedback resistor of 3.66KΩ. In the absence of any input signal, the  $V_{out}$  DC is set by

$$V_{out}(DC) = (1 + \frac{R_F}{R_B}) V_{in}(DC)$$

If an input signal is applied, the gain is set by

$$V_{out} = (\frac{R_F}{R_x}) V_{in}$$

**Input and Transfer Characteristics**

An input current swing of ±4.5mA causes the output to change by ±25V.

A resistor of 270Ω in series with the input will give a voltage gain of -13.

Input pins are internal dc feedback nodes and thus have low impedances. These pins must be fed from a series RC network for high frequency emphasis.

**Output Characteristics**

The CVA3424 is intended to be used as the final stage of very fast video circuits. The nominal load capacitance is 10pF. Other values can be accommodated since the output stage is an emitter follower and is fairly insensitive to load capacitance. However, a wire connection of some length is unavoidable, that causes objectionable ringing due to a resonant circuit. To avoid this a damping resistor must be used in series with the lead inductance. Also a resistor is necessary to protect the amplifier against arching. A resistor of 30-50Ω will provide protection but will slow down the response. The lead inductance may be artificially increased by a tenth of a microHenry to obtain desired peak. Any change in inductance will require readjustment of damping resistor, as stated by equation (1).

$$R^* = \sqrt{\frac{L}{C}} \quad (1)$$

The output of CVA3424 is not short circuit proof. Any resistance to V+ or Ground should be >600Ω.

**Thermal Characteristics**

When low frequency square waves are amplified, some droop will occur due to a large change in thermal dissipation in the input transistors. To overcome this an R-C series feedback network is suggested with 300kΩ and 46pF values. Under normal operating conditions the CVA3424 will dissipate up to 6W. The maximum allowed case temperature is +90°C. To calculate maximum heatsink thermal resistance use equation (2).

$$R_{th} = \frac{(90 - 50^\circ)}{6W} = 6.7^\circ C/W$$
