CX28224/5/9
Inverse Multiplexing for ATM (IMA) Family

Data Sheet

M1NDSPEED™

Ordering Information

Model Number	Manufacturing Part Number	Product Revision	Package	Operating Temperature
CX28224	28224-14	D	256-pin, 17 mm BGA	−40 °C to 85 °C
CX28225	28225-14	D	256-pin, 17 mm BGA	−40 °C to 85 °C
CX28229	28229-14	D	256-pin, 17 mm BGA	−40 °C to 85 °C

Revision History

Revision	Level	Date	Description
A	Preliminary	July 2001	Preliminary A version. Note that this document was also released as a preliminary version under the document numbers 101265P1 and 101265P2.
B	Preliminary	September 2001	Preliminary B version.
C	Preliminary	September 2001	Removed all references to PLCP and updated some of the bit descriptions.
D	Preliminary	April 2002	Restructured and enhanced document to include more IMA related information.
E	Preliminary	May 2002	Updated Ordering Information and a few register descriptions to reflect the CX28229-13 part.
F	Preliminary	September 2002	Updated to reflect the -14 part. Section 8, Electrical and Mechanical Specifications, improved and noted with change bars.
A	Released	January 2003	Revised document number to reflect new numbering system: new document number is 28229-DSH-001-B. Removed Prelimary document designations. Replaced hysteresis references with TTL levels in Table 8-16.

CX28224/5/9

Inverse Multiplexing for ATM (IMA) Family

The CX2822x family of devices provides system designers with a complete integrated IMA solution for up to 32 ports. All devices include a Transmission Convergence block to perform cell delineation, on-board RAM to meet ATM forum requirements for differential delay compensation and a dual mode (UTOPIA or Serial) PHY layer interface.

Source code for all required software functions is available from Mindspeed. Since all processing intensive functions are performed in hardware, they require only minimal overhead from the system processor.

The TC block is capable of bit level cell delineation, which allows for direct connection DSL serial data streams without a frame sync pulse. Individual ports can be operated in a 'pass thru' mode without the IMA overhead.

The CX28229 provides direct connection to 8 serial links or can be expanded to a 32 port IMA using the PHY side UTOPIA bus and external TC devices such as the RS8228. In addition, an external memory bus allows the differential delay memory to access up to 2 Mbytes of external RAM.

Distinguishing Features

- ◆ Complete IMA solution in a single package
  - 2 port, CX28224, 17mm BGA
  - 4 port, CX28225, 17mm BGA
  - 8/32 port, CX28229, 17mm BGA
- ◆ Field tested software available
- ◆ Supports up to 32 ports using external TC PHYs
- ◆ Up to 16 IMA groups
- ◆ Supports the IMA standard requirements for 25 ms differential delay with 256K Internal memory
- ◆ Memory expandable to 2 M bytes via external bus (CX28229 only)
- ◆ UTOPIA level 2 interfaces
- ◆ Glueless interface to Mindspeed Framers
- ◆ Octet or Bit level cell delineation
- ◆ Variable link data rates (64K–3.072 Mb/s)

Functional Block Diagram

Mindspeed Technologies™
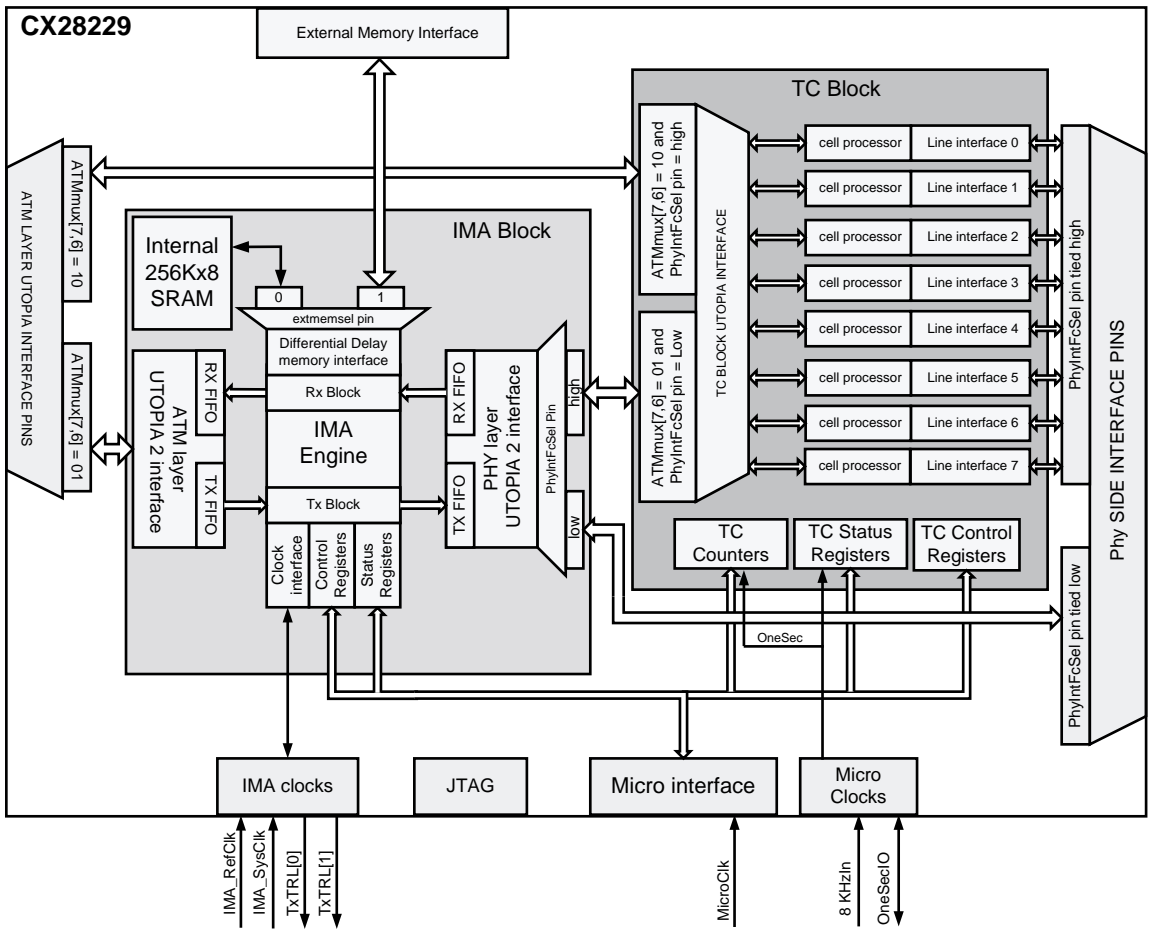

IMA Features

◆ Field proven design
◆ All software available
◆ Supports variable link data rates (64K–3.072 Mb/s)
◆ Internal memory
◆ Connects directly to the Mindspeed SARs for inexpensive CPE solutions
◆ CX28224 2 ports
◆ CX28225 4 ports
◆ CX28229 32 ports
  • Memory expandable to 2 M bytes via external bus
  • Up to 16 independent groups (using external PHYs):
    Each group can have up to 8 links.
◆ Supports IMA versions 1.0 and 1.1
◆ Fractional T1/E1

Cell Delineation Section

◆ Supports ATM cell interface for:
  • Circuit-based physical layer
  • Cell-based physical layer
◆ Performs single-bit HEC correction and single- or multiple-bit detection
◆ Inserts headers and generates HEC
◆ Direct connection to external Mindspeed components for:
  • T1/E1
  • xDSL
  • General purpose mode
◆ Byte-level or bit-level cell delineation

Control and Status

Microprocessor Interface

◆ Asynchronous SRAM-like interface mode
◆ Synchronous, glueless Bt8233/RS8234 SAR interface mode
◆ 8-bit data bus
◆ Open-drain interrupt output
◆ Open-drain ready output
◆ 8–33 MHz operation
◆ All control registers are read/write

UTOPIA Interfaces

◆ UTOPIA Level 2 Interface to ATM Layer:
  • 8/16 bit operation
  • 50 MHz
◆ PHY-side UTOPIA Interface:
  • 8-bit UTOPIA Level 2
  • Supports 32 ports via dual CLAV and Enable lines

Counters/Status Register Section

◆ Summary interrupt indications
◆ Configuration of interrupt enables
◆ One-second counter latching
◆ Counters for:
  • LOCD events
  • Corrected HEC errors
  • Uncorrected HEC errors
  • Transmitted cells
  • Matching received cells
  • Non-matching received cells

Introduction to IMA

This chapter provides a basic introduction to IMA. It will introduce common terminology, the IMA frame format and IMA Cell structure. It will also address one of the challenges of IMA: differential delay between links. For detailed coverage of these topics the reader should refer to the ATM forum's standard for IMA.

The CX2822x is composed of the following major functional blocks as shown in Figure 1-1.

Figure 1-1.   Block Diagram
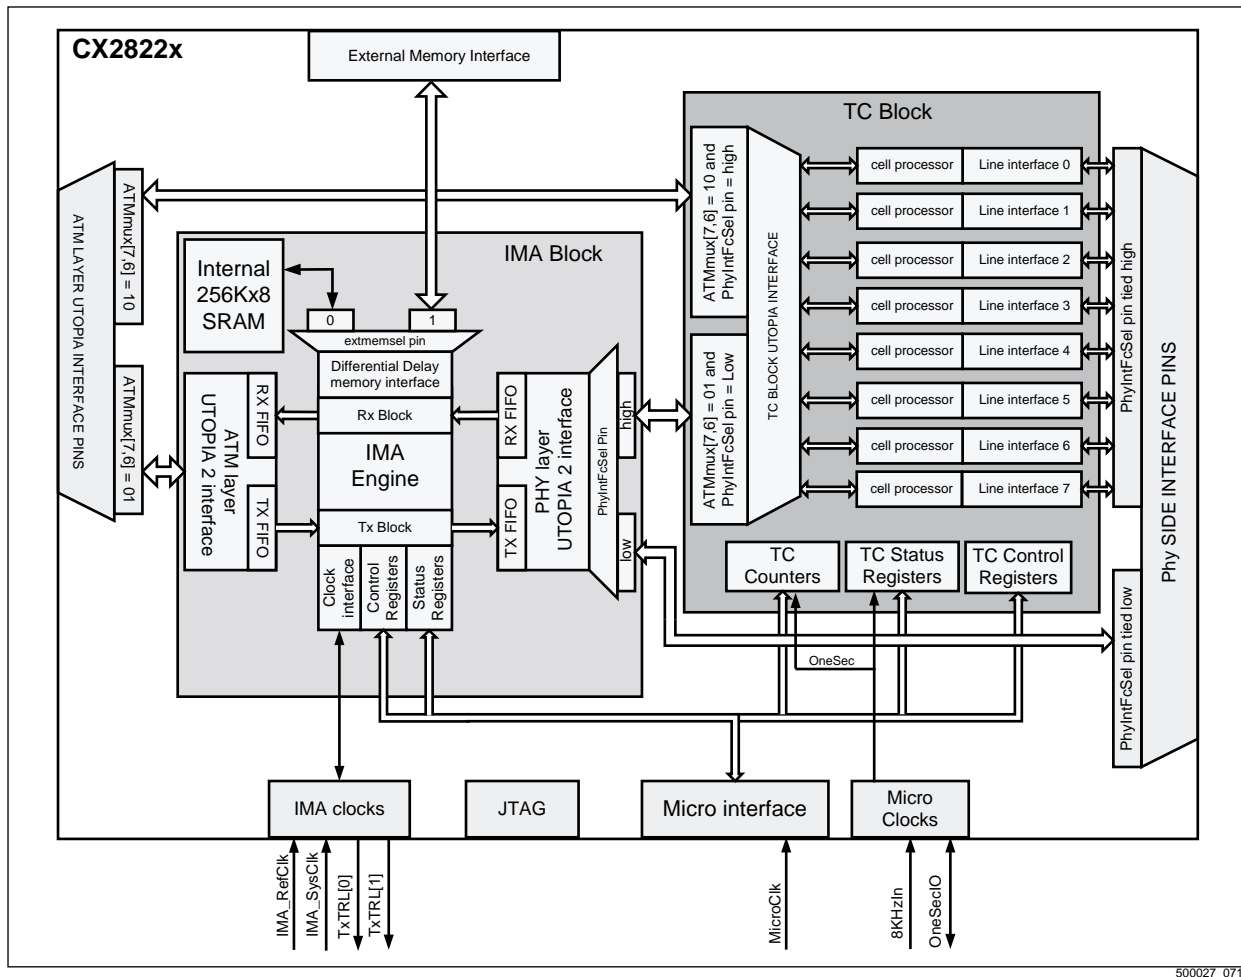

1.1   Introduction To Inverse Multiplexing for ATM

Bandwidth, or the lack thereof, has always been the main challenge of telecommunications. While numerous standards for high speed connections have been around for years, the cost of these higher speed connections often prohibit users from deploying them. For example, users who need a data rate higher than the standard T1, (1.544 Mbps) must pay for an entire DS3 (44 Mbps). Often the extra cost cannot be justified.

IMA solves this problem by allowing users to purchase bandwidth in smaller increments and combine these smaller 'pipes' into one high speed connection. An example is given in Figure 1-2 where 3 T1 lines are combined into one 4.6 Mbps data link.

At first glance, the concept of IMA is deceptively simple: spread the ATM cells out evenly over the available individual lines. However, many serious technical issues must be dealt with and a wide range of functions must be supported. These include IMA framing, differential delay accommodation, link/group state machines, IMA clocking, and maintenance. Several terms must be defined:

IMA Engine	The logic that performs the actual IMA function. This sits between the ATM layer and the individual links (see Figure 1-2). An IMA engine can control multiple independent groups.
Link	Refers to an individual physical connection such as a T1 or DSL line. Each link has an individual UTOPIA address or serial connection to the IMA engine.
Group	An IMA group is composed of links. A group appears as a single UTOPIA address to the ATM layer. Thus an IMA-4 group would have 4 individual links.
Group State Machine	The operation of the IMA group is governed by the Group State Machine (GSM), the Group Traffic State Machine (GTSM), and the Link Addition and Slow Recovery (LASR) procedure. These three processes ensure reliable transmission and reception of ATM layer cells across all links in the Active state. This includes the negotiation of group parameters (i.e., symmetry and M values), the bringing up of the IMA group, and the graceful addition/recovery and deletion of links to and from the group. For the CX28229, this function is performed in the host software. The software itself is available from Mindspeed.

Link State Machine   A Link State Machine (LSM) is defined for the transmit and receive directions of each IMA link. The IMA protocol is defined to allow symmetric or asymmetric cell rate transfer over the IMA virtual link. It allows for smooth introduction of each link in the group. It also allows graceful handling of error conditions and removal of a link. This function is performed internally by the CX28229.

Figure 1-2.   IMA Overview
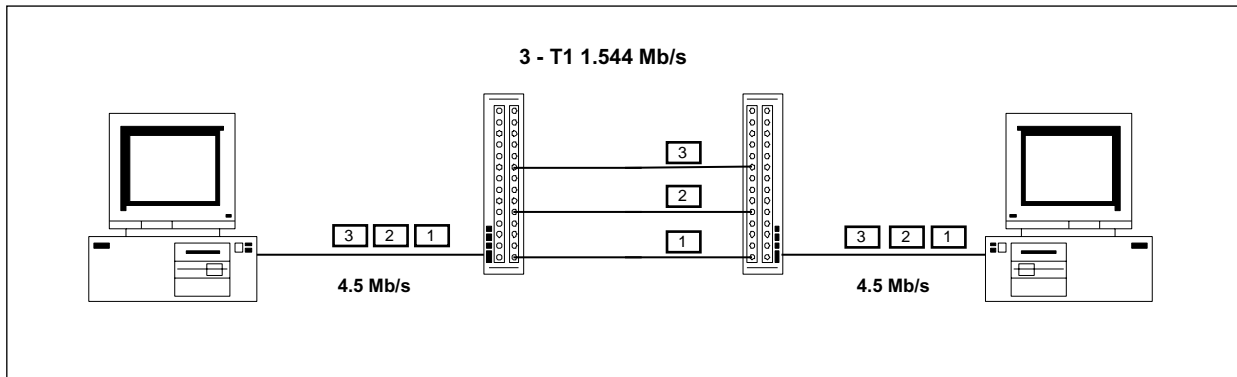

500027_053

1.1.1   IMA Framing

The IMA protocol employs a simple frame structure as shown in Figure 1-3. It consists of a single IMA overhead cell (ICP) and M – 1 ATM layer cells, where M is the IMA frame length. Valid frame lengths are 32, 64, 128 (default), or 256. This example shows a group composed of three links and an IMA frame length of 16. (An invalid frame length of 16 is used for brevity, the default frame length is 128.)

Figure 1-3.   IMA Frame; Length = 16; Number of links = 3
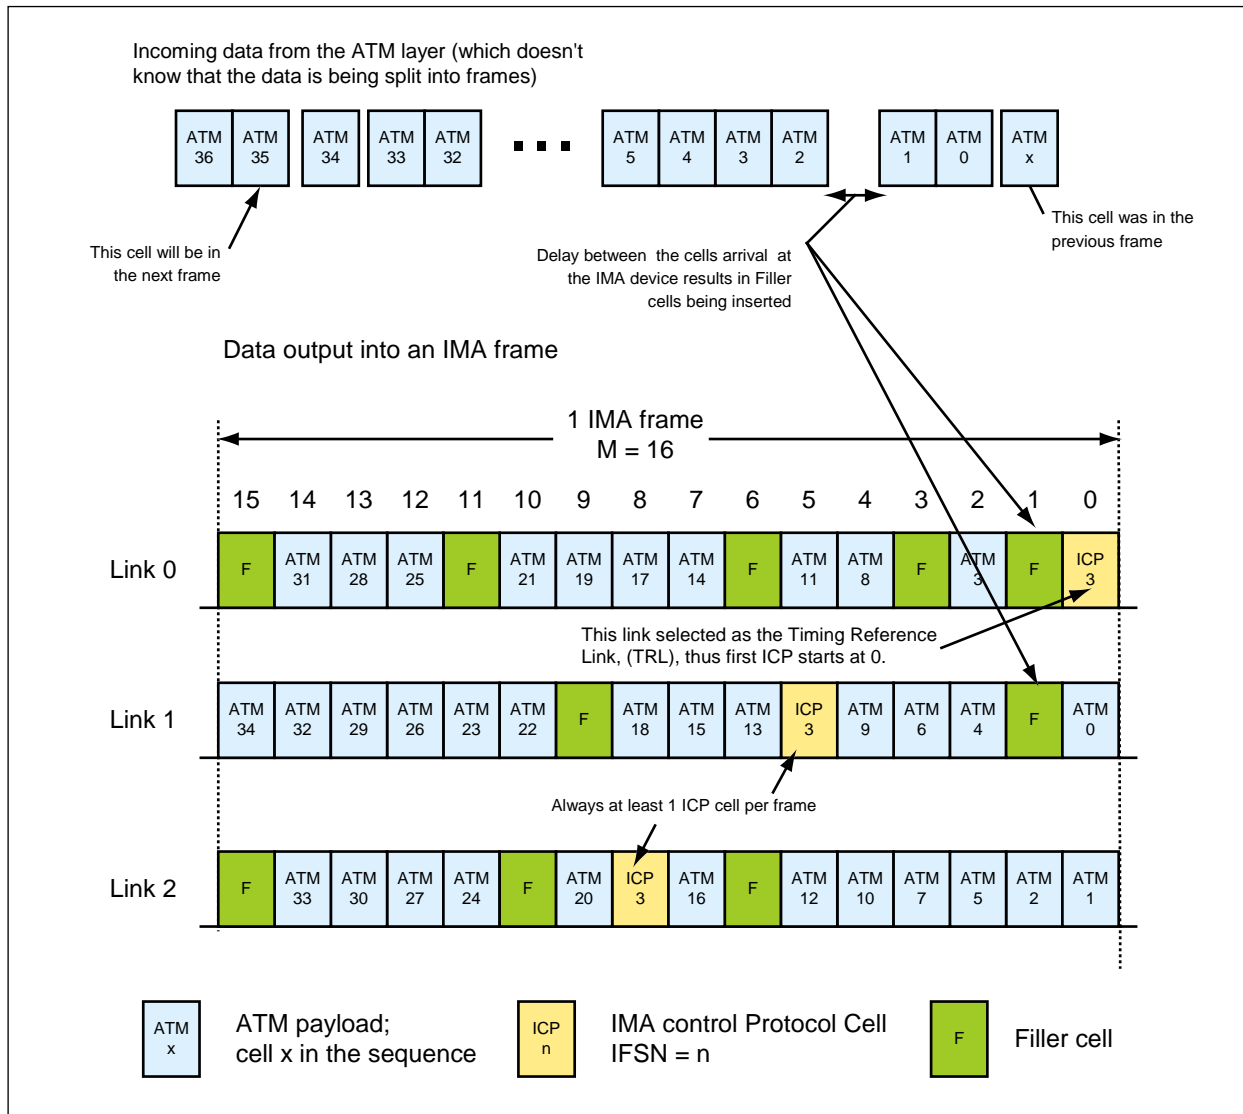

Since the ATM layer data rate is often less than the bandwidth available across the links in the IMA group, the IMA engine generates IMA Filler cells when no ATM layer cells are available. (The IMA Filler cells perform the same basic function as Idle cells in a non-IMA ATM system and are discarded by the IMA receiver.)

The IMA frame rate is intentionally set slightly below the available payload bandwidth of the IMA link. To allow for timing differences between the links in a group, the IMA standard requires that the system insert an extra ICP cell every 2049

cells. This cell is called the SICP cell and is inserted immediately after the normal ICP cell for that link and results in the frame being M+1 cells long. Information in the ICP cell payload signals the insertion of these cells so that the receiver does not lose framing and can identify and discard these cells. For further details consult the IMA standard.

One link in each group is designated the Timing Reference Link (TRL). All timing issues for the group are relative to this link.

1.1.2   IMA Control Protocol Cells

The IMA Standard defines three types of IMA cells: IMA Control Protocol (ICP) cells, Filler cells, and ATM layer cells. ICP cells are the IMA overhead cells that carry the IMA control and status information between both ends of the link, assuring synchronization and configuration. The purpose of filler cells is rate decoupling; they are inserted into the IMA stream if no ATM layer cells are available.

NOTE: Standard ATM 'idle' cells are never transmitted over an IMA link.

ATM layer cells are the data "payload" carried by the IMA group. These are the standard ATM cells being sent from the ATM layer.

Table 1-1 describes the IMA Overhead Cell definition, and Table 1-2 lists format of the IMA Overhead Stuff Cell.

Table 1-1. IMA Overhead Cell Definition (1 of 3)

Octet	Field	Description
1-5	ATM Cell Header	OAM cell type: Octet 1 = 0000 0000 Octet 2 = 0000 0000 Octet 3 = 0000 0000 Octet 4 = 0000 1011 Octet 5 = 0110 0100 (valid HEC with Coset)
6	IMA Label	OAM type field: 0000 0001—IMA Version 1.0 0000 0011—IMA Version 1.1
7	Cell ID Link ID	Bit 7 Set to 1 for ICP cell Bits 6–5 Unused and set to 0 Bits 4–0 Logical ID for physical link range (0... 31)
8	Frame Sequence Number	Cyclical counter: 0 to 255
9	ICP Cell Offset	Indicates position of ICP cell within the IMA frame of size M cells. Range: (0... $M-1$)

Table 1-1. IMA Overhead Cell Definition (2 of 3)

Octet	Field	Description
10	Link Stuff Indication (LSI)	Stuff Indication code for link on which ICP cell is being sent Bits 7–3 Unused and set to 0 Bits 2–0 111: no imminent stuff (default) 100: stuff event in 4 ICP cell locations (optional) 011: stuff event in 3 ICP cell locations (optional) 010: stuff event in 2 ICP cell locations (optional) 001: stuff event at the next ICP cell location (mandatory) 000: This is one out of the 2 ICP cells comprising the stuff event (mandatory)
11	Status / Control Change Indication (SCCI)	Status and Control Change Indication: 0 to 255 and cycling (count to be incremented every time there is a change to octets 12 to 49).
12	IMA ID	Logical IMA group ID
13	Group Status & Control	Bits 7–4 Group Status 0000: Start-up 0001: Start-up-Ack 0010: Config-Aborted: Unsupported M 0011: Config-Aborted: Incompatible Symmetry 0100: Config-Aborted: Unsupported IMA version 01xx: Available for other Config Abort reasons 1000: Insufficient-Links 1001: Blocked 1010: Operational Bits 3–2 Others: Reserved Symmetry of Group 00: Symmetrical configuration and operation 01: Symmetrical configuration and asymmetric operation 10: Asymmetrical configuration and operation Bits 1–0 11: Reserved IMA Frame Length 00: M=32 01: M=64 10: M=128 11: M=256
14	Transmit Timing Information	Transmit Clock Information Bits 7–6 Unused, set to 00 Bit 5 Transmit Clock Mode (0: ITC mode, 1: CTC mode) Bits 4–0 Tx LID of the timing reference link (TRL)—Range: 0 to 31

Table 1-1. IMA Overhead Cell Definition (3 of 3)

Octet	Field	Description
15	Tx Test Control	Test Pattern Command Bits 7–6 Unused, set to 00 Bit 5 Test Link Command (0: inactive, 1: active) Bits 4–0 Tx LID of test link—Range: 0 to 31
16	Tx Test Pattern	Value from 0 to 255
17	Rx Test Pattern	Value from 0 to 255
18	Link 0 Information	Link State Machine and Defect Information for link with LID = 0 Bits 7–5 Transmit LSM state Bits 4–2 Receive LSM state Bits 1–0 Rx Link defect status 00: no errors 01: Physical Link defect (e.g., LOS, OOF/LOF, LCD) 10: LIF 11: LODS
19–49	Link 1–31 Info	Status and control of link with LID in the range 1–31
50	Unused	Set to 0x6A (as defined in ITU-T I.432)
51	End-to-end channel	Proprietary channel (set to 0 if unused). The CX2822x does not support this octet.
52–53	CRC Error Control	Bits 15-10 Reserved field for future use—default value is all zeros Bits 9-0 CRC-10 as defined in ITU-T Recommendation I.610

Table 1-2. IMA Overhead Filler Cell Format

Octet	Field	Description
1–5	ATM Cell Header	OAM cell type: Octet 1 = 0000 0000 Octet 2 = 0000 0000 Octet 3 = 0000 0000 Octet 4 = 0000 1011 Octet 5 = 0110 0100 (valid HEC)
6	IMA Label	OAM type field: 0000 0001—IMA Version 1.0 0000 0011—IMA Version 1.1
7	Cell ID Link ID	Bit 7 Set to 0 for IMA Filler cell Bits 6–0 Unused and set to 0
8–51	Unused	Set to 0x6A (as defined in ITU-T I.432)
52–53	CRC Error Control	Bits 15-10 Reserved field for future use—default value is all zeros Bits 9-0 CRC-10 as defined in ITU-T Recommendation I.610

1.1.3   Link State Machine

Management of the individual links is performed by two state machines: the Transmit Link State Machine and the Receive Link State Machine. Four possible states are available for each link as shown in Table 1-3.

Table 1-3. Link States

State	Description
Not in Group	this link has not been added to an IMA group
Unusable	the link is in a group but cannot be used due to line fault etc.
Usable	assigned to a group and ready but is waiting for the other end
Active	fully configured and carrying traffic

The Link State Machines are responsible for handling the transition from one state to another. All functions of the LSM's are performed internally by the CX2822x. Further details are covered in Chapter 3 and in the ATM standard on IMA.

1.1.4   Transmit Clocks

The IMA standard provides two options regarding the transmit clocks. The default mode, and most common IMA application, is Common Transmit Clock (CTC) mode, where all links in the IMA group are generated from the same source. Thus they are in phase and have the same rate of SICP insertion (1/2049) as the designated TRL link.

The Independent Transmit Clock (ITC) mode is available as an optional feature of the IMA protocol (of course, it is fully supported by the CX2822x family). In this mode, each link runs off of an independent clock at the nominal line rate. To support these asynchronous links within an IMA group, the rate of SICP insertion is allowed to vary on the non-TRL links.

The IMA group frame rate for each IMA group must be re-created at the receive end. This regeneration is necessary to implement the IMA Data Cell Clock and smoothing buffer functionality of the IMA protocol. One method for generating the Receive IMA group frame rate is to use the line or payload clock recovered from the receive TRL physical port interface. This clock is a frequency locked reference of the far-end Transmit IMA group frame rate. Equivalently, the rate of cell transfers (i.e., payload bandwidth) from the TRL link can be used as the reference for generating the Receive IMA group frame rate. Both methods are available for use by the CX2822x device, depending on the application and configuration.

1.1.5   Differential Delay

When dealing with multiple facilities, there is no guarantee that the individual links within a group will take the same physical path between the terminating equipment. This variation is referred to as Differential Delay. The ATM Forum specification requires an IMA implementation to absorb a minimum of 25 ms of differential delay between the links. Each port requires 8 K of memory for every 27.5 ms of delay (at E1; 8 K provides for 34.375 ms at T1 rates). The CX28229 provides 256K bytes of on-board memory for the buffering necessary to re-align the links within an IMA group. This is sufficient to support the 25 ms delay for 32 IMA ports. In addition, an external memory bus allows this to be expanded to 2 MB, which supports up to 200 ms of delay. Table 1-4 shows the memory requirements for differential delay.

Table 1-4. Memory Requirements for Differential Delay (in bytes)

Number of ports	E1	27.5 ms	55 ms	110 ms	220 ms
	T1	34.375 ms	68.75 ms	137.5 ms	275 ms
1		8 K	16 K	32 K	64 K
2		16 K	32 K	64 K	128 K
4		32 K	64 K	128 K	256 K
8		64 K	128 K	256 K	512 K
16		128 K	256 K	512 K	1024 K
32		256 K	512 K	1024 K	2048 K
GENERAL NOTE: Shaded areas can be supported by internal memory. Internal memory is disabled when the external bus is used.					

The magnitude of the differential delay can be quite large when dealing with T1/E1 links; whereas DSL links generally follow the same path and have nearly identical delays.

1.2   Software Overview

NOTE: Mindspeed's software supports both TC and IMA; however, this section only describes IMA software support.

All IMA devices require a software driver to interface to the system host. Since the GSM's primary function only occurs during startup; the CX2822x family relies on the IMA driver to perform these functions. This allows for maximum flexibility; simpler device design and requires very little overhead from the host.

Mindspeed provides a complete IMA and device driver in ANSI C to simplify system development. This software has been field tested and can be ported to virtually all systems. This is also covered in chapter 3, the IMA engine and the CX28229TAP IMA Software Programming Guide.

Table 1-5 summarizes the API of the CX28224/5/9 software. All functions require a pointer to the structure IMA_DEV. The additional parameters for each function are listed in the following sections. The functions named **IMA_xxxx()** are function calls to the CX28224/5/9. The functions named **USER_xxxx()** are user defined functions called by the CX28224/5/9. The pointers to the user defined functions are passed to CX28224/5/9 during initialization as fields in the DRV initialization structure or after initialization using the **IMA_subsys_set()** function.

Table 1-5. Software Function Summary (1 of 2)

Class	Function	Short Description
Initialization	IMA_init_default ()	Initializes the fields of the CX28224/5/9 initialization structure to default values.
	IMA_init ()	This function initializes the IMA software driver and the IMA device.
Interrupts	IMA_tick ()	This function polls the error counters and failure monitoring registers of the IMA device and must be called at a regular periodic interval.
	IMA_intr ()	This function should be called when the device interrupt line has been asserted.
IMA Subsystem	IMA_read ()	This function provides a direct interface to read the registers within the IMA device.
	IMA_write ()	This function provides a direct interface to write the registers within the IMA device.
	IMA_subsys_set ()	This function provides a direct interface to set the CX28224/5/9 Subsystem parameters.
	IMA_subsys_get ()	This function provides a direct interface to retrieve the CX28224/5/9 Subsystem parameters.
	IMA_test ()	This function executes a specified IMA diagnostic test.
	IMA_facility_set()	This function provides a direct interface to set the CX28224/5/9 Facility parameters.
	IMA_facility_get()	This function provides a direct interface to retrieve the CX28224/5/9 Facility parameters.

Table 1-5. Software Function Summary (2 of 2)

Class	Function	Short Description
Group Interface	IMA_group_set ()	This function provides a direct interface to set the $CX28224/5/9$ Group parameters.
	IMA_group_get ()	This function provides a direct interface to retrieve the $CX28224/5/9$ Group parameters.
	IMA_group_FM_status ()	This function retrieves the current state of the parameters monitored by the Facility Monitoring subsystem for the IMA Group layer.
	IMA_group_PM_preset ()	This function allows the user to initialize the IMA Group PM statistics to arbitrary values for the current interval of the 15 minute accumulation period.
	IMA_group_PM_status ()	This function retrieves the states (from either the current or previous 15 minute accumulation interval) of the IMA Group Performance Monitoring parameters.
Link Interface	IMA_link_set ()	This function provides a direct interface to set the $CX28224/5/9$ Link parameters.
	IMA_link_get ()	This function provides a direct interface to retrieve the $CX28224/5/9$ Link parameters.
	IMA_link_FM_status ()	This function retrieves the current state of the parameters monitored by the Facility Monitoring subsystem for the IMA Link layer.
	IMA_link_PM_preset ()	This function allows the user to initialize the IMA Link PM statistics to arbitrary values for the current interval of the 15 minute accumulation period.
	IMA_link_PM_status ()	This function retrieves the states (from either the current or previous 15 minute accumulation interval) of the IMA Link Performance Monitoring parameters.
PHY Interface	IMA_phy_link_set ()	This function provides a direct interface to set the $CX28224/5/9$ Link parameters, per facility.
	IMA_phy_link_get ()	This function provides a direct interface to retrieve the $CX28224/5/9$ Link parameters, per facility.
	IMA_phy_link_FM_status ()	This function retrieves the current state of the parameters monitored by the Failure Monitoring subsystem for the IMA Link layer, per facility.
	IMA_phy_link_PM_preset ()	This function allows the user to initialize the IMA Group PM statistics to arbitrary values for the current interval of the 15 minute accumulation period.
	IMA_phy_link_PM_status ()	This function retrieves the states (from either the current or previous 15 minute accumulation interval) of the IMA Link Performance Monitoring parameters, per facility.
Monitor	IMA_mon()	This function is called to control the $CX28224/5/9$ debugger.
User Defined	*USER_intr_disable()	This is an application defined function that disables interrupts from the IMA hardware device.
	*USER_intr_enable()	This is an application defined function that enables interrupts from the IMA hardware device.
	* USER_event ()	This is an application defined function that accepts asynchronous event messages from the $CX28224/5/9$ software.

1.2.1   Software Subsystems

The internal architecture of the CX28229TAP software is composed of five logical subsystems: Configuration (CF), Diagnostics (DG), IMA Group (GRP), Failure Monitoring (FM), and Performance Monitoring (PM).

The following sections summarize the interfaces of the CX28224/5/9 IMA software device driver. It is important to point out that the CX28224/5/9 products can be configured to run in different operating environments. As such, not all the interfaces described below are used in a given application.

1.2.2   Configuration (CF)

The CF subsystem is responsible for setting the operating parameters of the IMA device that are associated with the IMA Link and IMA Group termination entities. Additionally, some of the application specific configurations of the device are set by this subsystem. The default value for each parameter is used to initialize and set the operating mode of the device.

1.2.3   Diagnostics (DG)

The DG subsystem performs control and testing functions on the IMA device and its environment. One role of the DG subsystem is configuration, very similar to the CF subsystem but with different parameters. Similar in function to the Configuration subsystem, the default value for each DG parameter is used to initialize and set the operating mode of the device. The DG subsystem parameters are typically exercised only during test or maintenance conditions, and may affect ATM transmission through the device.

1.2.4   Failure Monitoring (FM)

The Failure Monitoring (FM) subroutine is responsible for monitoring the IMA links and groups for defects and anomalies and integrating the defects into failures. The primary role performed by this subsystem is alarm integration. The CX28229TAP program is aware of changes in the state of the underlying defects and anomalies through periodic polling. The user has control over which Failure indicators are monitored and the length of both the activation and decay times.

Upon initializing the CX28229TAP, the Failure indications required by the ATM MIB are enabled and the activation and decay times are set at 2.5 and 10 seconds, respectively.

1.2.5   Performance Monitoring (PM)

This is the set of functions and capabilities necessary for a Network Element (NE) to gather, store, and report performance data associated with its monitored digital transmission entities In contrast with alarm/status indications, performance parameters are quantitative, not binary, in nature. These performance parameters are gathered over programmable, predetermined accumulation periods. The CX28229TAP calculates these statistics over 15 minute intervals. The PM data is available to the application grouped in a structure encompassing one of the two accumulation sets: the current 15 minute interval or the previous 15 minute interval. The PM subsystem uses the raw anomaly and defect information obtained by the FM subsystem to calculate its performance statistics.

Upon initialization, the PM subsystem is basically disabled: none of the monitored statistics are calculated.

1.2.6   Group State Machine

Overall management of each Group is the responsibility of the Group State Machine. This actually involves three interrelated processes: the Group State Machine (GSM), the Group Traffic State Machine (GTSM), and the Link Addition and Slow Recovery (LASR) procedure. These three processes are used to ensure reliable transmission and reception of ATM layer cells across all links in the Active state. This includes the negotiation of group parameters (i.e., symmetry and M values), the bringing up of the IMA group, and the graceful addition/recovery and deletion of links to and from the group. The seven possible states are shown in Table 1-6. Again, this will be covered in more detail in Chapter 3 and in the ATM standard on IMA.

Table 1-6. Group State Machine

State	Description
Not Configured	no groups configured
Start up	Waiting to establish communications with the other end
Start up Ack	Start Up acknowledge; has recognized the far end and waiting to enter the Insufficient links state
Config Aborted	results when the Far End doesn't comply with the requested configuration parameters
Insufficient links	Both ends have accepted the group parameters and are waiting for the LSM to provide active links
Blocked	The host controller has inhibited the group (probably for maintenance reasons)
Operational	Fully operational and able to pass data

Mindspeed Technologies™

2

CX2822x Hardware Description

Three versions of Mindspeed's IMA solution are available: CX28224, CX28225, and the CX28229. All use the same software drivers and are basically pin compatible. Table 2-1 provides a quick comparison of the three devices.

Table 2-1. Available Parts

Device	Internal memory	External memory interface	UTOPIA addresses (PHY side)	Serial ports
CX28224	128 Kbytes	None	0, 1, 31 (NULL)	2
CX28225	256 Kbytes	None	0–3, 31 (NULL)	4
CX28229	256 Kbytes	2 Mbyte[1]	0–31[2]	8

FOOTNOTE:
[1] Internal memory is disabled when the external bus is used.
[2] Normally, 0x31 is the NULL address; however, the CX28229 can be configured to treat it as a valid port address.

The following three configurations are available:

- UTOPIA-to-Serial
- UTOPIA-to-UTOPIA
- Stand-alone Cell Delineation only

2.1   Logic Diagram

Figures 2-1 and 2-4 illustrate the logic diagrams of the CX2822x's functional modules. Pin descriptions are listed in Table 2-10.

Figure 2-1.   CX28229 Logic Diagram (UTOPIA-to-UTOPIA)

2.2 Pin Diagram and Definitions (UTOPIA-to-UTOPIA Configuration)

Figure 2-3 is the pinout diagram for the CX28229 when operating in the UTOPIA-to-UTOPIA mode. It is a single CMOS integrated circuit packaged in a 256-pin BGA. All unused input pins should be connected to ground or power. Unused outputs should be left unconnected.

NOTE: UTOPIA-to-UTOPIA configuration is selected by tying the PhyIntFcSel pin low.

Figure 2-2 is a block diagram of a 32 port IMA solution using the device in the UTOPIA-to-UTOPIA mode. In this case, the Cell Delineation and the interface to the framers is performed by RS8228's. The framers could be T1/E1 or DSL. Further details can be found in the Mindspeed reference designs available online. Configuration information is shown in Table 2-2.

Figure 2-2.   IMA Block Diagram

Table 2-2. UTOPIA-to-UTOPIA Configuration Information

ATMMux [7,6] (ATMINTFC, 0x202)	PhyIntFcSel (Pin R4)	Description
01	Low	IMA UTOPIA using the PHY Side UTOPIA; Internal TC block and serial ports not used.
GENERAL NOTE: Use of external memory is optional.		

Figure 2-3. CX28229 Pinout Diagram UTOPIA-to-UTOPIA (Top View)

Table 2-3. CX2822x Pin Descriptions (1 of 12)

	Pin Label	Signal Name	No.	I/O	Description
Micro Interface	StatOut[0]	Status Output	M1	O	General purpose output pins under software control.
	StatOut[1]		M2		
	MSyncMode	Microprocessor Synchronous/ Asynchronous Bus Mode Select	N5	I	Selects synchronous or asynchronous bus mode, which determines the functions of two pins, MW/R, MRd* (pin A2) and MAS*,MWr* (pin A1). A logic 1 selects the synchronous bus mode, compatible with Bt8230 and Bt8233. In this mode, these pins are defined as follows: MW/R (A2) and MAS* (A1). A logic 0 selects the asynchronous SRAM-type bus mode. In this mode, the pins are defined as follows: MRd* (A2) and MWr* (A1).
	Reset*	Device Reset	P5	I	When asserted low, resets the device. The microprocessor clock must be present before reset is released.
	8kHzIn	8 kHz Input	N6	I	A clock input used to derive OneSecIO. Typically operates at a frequency of 8 kHz.
	OneSecIO	One-Second Input/ Output	R5	I/O	Software can configure this pin as an output that equals the input from the 8kHzIn divided by 8000. When configured as an input, status registers and counters may be latched on the rising edge of this input. See Bit 0 of the Mode register (0x200).
	MW/R, MRd*	Microprocessor Write/Read	A2	I	When MSyncMode is asserted high, this pin is a read/write control pin. In this mode, when MW/R is asserted high, a write access is enabled and the MicroData[7:0] pin values will be written to the memory location indicated by the MicroAddr[10:0] pins. Also, when MW/R is asserted low in this mode, a read access is enabled and the memory location indicated by the MicroAddr[10:0] pins is read. Its value is placed on the MicroData[7:0] pins. Both read and write accesses assume the device is chip selected (MCS* = 0), the address is valid (MAS* = 0), and the device is not being reset (Reset* = 1). When MSyncMode is asserted low, this pin is a read control pin. In this mode, when MRd* is asserted low, a read access is enabled and the memory location indicated by the MicroAddr[10:0] pins is read. Its value is placed on the MicroData[7:0] pins.
	MCS*	Microprocessor Chip Select	B2	I	When asserted low, the device is selected for read and write accesses. When asserted high, the device will not respond to input signal transitions on MicroClk, MW/R, MRd*, or MAS*, MWr*. Additionally, when MCS* is asserted high, the MicroData[7:0] pins are in a high-impedance state but the MicroInt* pin remains operational.

Table 2-3. CX2822x Pin Descriptions (2 of 12)

	Pin Label	Signal Name	No.	I/O	Description
Micro Interface	MAS*, MWr*	Microprocessor Address Strobe	A1	I	When MSyncMode is asserted high, this pin is an address strobe pin. When the MAS* pin is asserted low, it indicates a valid address, MicroAddr[10:0]. This signal is used to qualify read and write accesses. When MSyncMode is asserted low, this pin is a write control pin. When MWr* is asserted low, a write access is enabled and the MicroData[7:0] pin values will be written to the memory location indicated by the MicroAddr[10:0] pins. The write access assumes the device is chip selected (MCS* = 0), a read access is not being requested (MRd* = 1), and the device is not being reset (Reset* = 1).
	MicroAddr[0]	Microprocessor Address Bus	B1	I	These 11 bits are an address input for identifying the register to access.
	MicroAddr[1]		C2		
	MicroAddr[2]		E4		
	MicroAddr[3]		D2		
	MicroAddr[4]		C1		
	MicroAddr[5]		D1		
	MicroAddr[6]		E3		
	MicroAddr[7]		F4		
	MicroAddr[8]		E2		
	MicroAddr[9]		E1		
	MicroAddr[10]		M4		
	MicroData[0]	Microprocessor Data Bus	N3	I/O	A bi-directional data bus for reading and writing data to internal registers.
	MicroData[1]		N4		
	MicroData[2]		N1		
	MicroData[3]		N2		
	MicroData[4]		P2		
	MicroData[5]		P1		
	MicroData[6]		R1		
	MicroData[7]		R2		
	MicroInt*	Microprocessor Interrupt Request	T1	O	When active low, the device needs servicing. It remains active until the pending interrupt is processed by the Interrupt Service Routine. This pin is an open drain output for an external wired OR logic implementation. An external pull-up resistor is required for this pin.

Table 2-3. CX2822x Pin Descriptions (3 of 12)

	Pin Label	Signal Name	No.	I/O	Description
Micro Interface	MRdy	Microprocessor Ready	T2	O	When active high, the current read or write transaction has been completed. For a read transaction, the data is ready to be transferred to the microprocessor. For a write transaction, the data provided by the microprocessor has been written. This pin is an open drain output for an external wired OR logic implementation. An external pull-up resistor is required for this pin.
	MicroClk	Microprocessor Clock	R3	I	An 8–50 MHz clock signal input. The device samples the microprocessor interface pins (MCS*, MW/R, MRd*, MAS*, MicroAddr[10:0], and MicroData[7:0]) on the rising edge of this signal. The microprocessor interface output pins (MicroData[7:0], MicroInt*) are clocked on the rising edge of MicroClk. Note that this clock is required for both synchronous and asynchronous operations. See note in Section 6.1.
External Memory[1]	ExtMemSel	External Memory Enable	C13	I/PD	When this pin is pulled high, it enables the external differential delay SRAM bus. This pin is internally pulled low on the CX28224/5.
	MemData[0][1]	Differential Delay Memory Data Bus	T5	I/O/PD	Differential delay SRAM Data Bus. ATM cells extracted from the Receive data stream are stored in the SRAM for the purpose of differential delay compensation.

	MemAddr[17][1]		K1		
	MemAddr[18][1]		K2		
	MemAddr[19][1]		P3		
	MemCtrl_CE*[1]	Chip Enable	L3	O	Receive SRAM Device Select (active low) control signal. This signal is enabled by pulling the ExtMemSel pin high.
	MemCtrl_OE*[1]	Output Enable	L4	O	Receive SRAM Device Output (active low) control signal. This signal is enabled by pulling the ExtMemSel pin high.
	MemCtrl_WE*[1]	Write Enable	L1	O	Receive SRAM write enable (active low) control signal. This signal is enabled by pulling the ExtMemSel pin high.
	MemCtrl_CLK[1]	SRAM Clock	L2	O	Receive SRAM clock signal. This signal is enabled by pulling the ExtMemSel pin high.
	MemCtrl_ADSC[1]	Address Enable	M3	O	Receive SRAM address enable (active low) address strobe. This signal is enabled by pulling the ExtMemSel pin high.

Table 2-3. CX2822x Pin Descriptions (5 of 12)

	Pin Label	Signal Name	No.	I/O	Description
JTAG	TRST*	Test Reset	E13	I/PU	When asserted, the internal boundary-scan logic is reset. This pin has a pull-up resistor. Do not assert this reset unless a clock is provided on TCK.
	TCK	Test Clock	F13	I	Samples the value of TMS and TDI on its rising edge to control the boundary scan operations.
	TMS	Test Mode Select	E14	I/PU	Controls the boundary-scan Test Access Port (TAP) controller operation. This pin has a pull-up resistor.
	TDI	Test Data Input	F16	I/PU	The serial test data input. This pin has a pull-up resistor.
	TDO	Test Data Output	F15	O	The serial test data output.
Test	TestEnable		T3	I	Factory test use only, tie to VSS.
	TestMode		T4	I	Factory test use only, tie to VSS.
PHY Side Interface	PhyIntFcSel	PHY Interface Select	R4	I	If this pin is tied low, the PHY UTOPIA Interface mode is selected. This table shows pin configurations with this pin tied low. If this pin is tied high, the PHY Serial mode is selected.
	phyURxClk	UTOPIA Receive Clock	R7	O	IMA_SysClk/2
	phyURxEnb[0]*	PHY UTOPIA Receive Enable	N8	O	Data transfer and output enable for Receive PHY cells (active low). To support multiple PHY devices, separate enable signals are provided. Depending on the software configuration, some of the enable signals may not be available and will be replaced by additional PHY cell bus address bits. PhyURxEnb[1] is a No Connect on the CX28224/5 devices.
	phyURxEnb[1]*		P14		
	phyURxAddr[0]	PHY UTOPIA Receive Address	T6	O	Receive PHY Cell Bus address. The following limitations apply:
	phyURxAddr[1]		T7		
	phyURxAddr[2]		P8		
	phyURxAddr[3]		T8		
	phyURxAddr[4]		R8		
	phyURxClAv[0]	PHY UTOPIA Receive Cell Available	N9	I	Cell Available signals for Receive PHY interfaces. phyURxClAv{n} is active when one or more complete cells can be transferred. To support different PHY devices, separate cell available signals are provided. This allows expansion to 32 points. PhyURxClAv[1] is a No Connect on the CX28224/5 devices.
	phyURxClAv[1]		T16	I/PD	

Within the phyURxAddr description:

Device	Addresses

	atmUTxData[15]		A15	I/PD	
	atmUTxPrty	ATM UTOPIA Transmit Parity	A13	I	Parity status signal. In 8 bit Utopia mode, a parity calculation is performed over atmUTxData[7:0] for each clock cycle of atmUTxClk. Odd parity is used. In 16 bit Utopia mode, this signal is the parity of atmUTxData[15:0]. This signal is optional.

Table 2-3. CX2822x Pin Descriptions (9 of 12)

	Pin Label	Signal Name	No.	I/O	Description
ATM Layer UTOPIA Interface	atmUTxClAv	ATM UTOPIA Transmit Cell Available	C12	O	Cell Available signal for transmit ATM cells (active high).
	atmUTxSOC	ATM UTOPIA Transmit Start of Cell	D11	I	Start of Cell synchronization signal for transmit ATM cells (active high). Indicates that the first byte/word of the 53 byte cell is being placed on the atmUTxData bus.
	atmUTxEnb*	ATM UTOPIA Transmit Enable	B12	I	Data transfer enable for transmit ATM cells (active low). Indicates that the first byte/word of the 53 byte cell is being placed on the atmUTxData bus.
	atmUTxClk	ATM UTOPIA Transmit Clock	A12	I	Clock signal used for transfer of transmit ATM cells from the ATM Layer. The maximum clock rate is 33 MHz.
	atmURxSOC	ATM UTOPIA Receive Start of Cell	C9	O	Start of Cell synchronization signal for receive ATM cells (active high). Indicates that the first byte/word of the 53 byte cell is being placed on the atmURxData bus.
	atmURxClk	ATM UTOPIA Receive Clock	A9	I	Clock signal used for transfer of receive ATM cells from the ATM Layer. The maximum clock rate 33 MHz.
	atmURxClAv	ATM UTOPIA Receive Cell Available	B9	O	Cell Available signal for receive ATM cells (active high). As a software option in the IMA16 application, the pin atmURxAdr[4] will function as a cell available status signal (atmURxClAv[1]) for ATM Utopia addresses 8–15 only. In this mode, atmURxClAv[1] will threestate for addresses 0–7.
	atmURxEnb*	ATM UTOPIA Receive Enable	D8	I	Data transfer and output enable for receive ATM cells (active low).

Table 2-3. CX2822x Pin Descriptions (10 of 12)

	Pin Label	Signal Name	No.	I/O	Description
ATM Layer UTOPIA Interface	atmURxData[0]	ATM UTOPIA Receive Data	C8	O	Receive direction ATM side cell data. CX28224 only supports an 8 bit data path. Thus atmURxData[8:15] are no-connects.

	VGG	Electrostatic Discharge (ESD) Supply Voltage	B3		Provides ESD protection when interfacing with 5 V systems. If using this device in a system with 5 V logic, this pin must be connected to 5 V. If using 3.3 V system, connect to 3.3 V.

FOOTNOTE:
(1) This bus is enabled by pulling the ExtMemSel pin high. External Memory is disabled on the CX28224 and CX28225 versions of the device.

2.3 Pin Diagram and Definitions (UTOPIA-to-Serial Configuration)

Figure 2-6 illustrates a pinout diagram for the CX28229 when operating in UTOPIA-to-Serial mode. It is a single CMOS integrated circuit packaged in a 256-pin BGA. All unused input pins should be connected to ground or power. Unused outputs should be left unconnected.

NOTE: UTOPIA-to-Serial configuration is selected by tying the PhyIntFcSel pin high.

Figure 2-5 is a block diagram of an 8 link IMA solution using the device in the UTOPIA-to-serial mode to take advantage of the internal serial ports. Cell Delineation is performed internally and the CX2822x interfaces directly to the framers. These framers could be T1/E1 or DSL. Further details can be found in the Mindspeed reference design available online. Configuration information is shown in Table 2-4.

ATMMux [7,6] (ATMINTFC, 0x202)	PhyIntFcSel (Pin R4)	Description
01	High	IMA UTOPIA using Internal TC block; UTOPIA-to-Serial mode using 8 internal serial ports.
GENERAL NOTE: External memory could be used if desired (CX28229).		

Figure 2-6. CX28229 Pinout Diagram, UTOPIA-to-Serial (Top View)

Table 2-5. CX28229 Pin Descriptions (1 of 12)

	Pin Label	Signal Name	No.	I/O	Description
Micro Interface	StatOut[0]	Status Output	M1	O	General purpose output pins under software control.
	StatOut[1]		M2		
	MSyncMode	Microprocessor Synchronous/ Asynchronous Bus Mode Select	N5	I	Selects synchronous or asynchronous bus mode, which determines the functions of two pins, MW/R,MRd* (pin A2) and MAS*,MWr* (pin A1). A logic 1 selects the synchronous bus mode, compatible with Bt8230 and Bt8233. In this mode, these pins are defined as follows: MW/R (A2) and MAS* (A1). A logic 0 selects the asynchronous SRAM-type bus mode. In this mode, the pins are defined as follows: MRd* (A2) and MWr* (A1).
	Reset*	Device Reset	P5	I	When asserted low, resets the device. The microprocessor clock must be present before reset is released.
	8kHzIn	8 kHz Input	N6	I	A clock input used to derive OneSecIO. Typically operates at a frequency of 8 kHz.
	OneSecIO	One-Second Input/ Output	R5	I/O	Software can configure this pin as an output that equals the input from the 8kHzIn divided by 8000. When configured as an input, status registers and counters may be latched on the rising edge of this input. See Bit 0 of the Mode register (0x200).
	MW/R, MRd*	Microprocessor Write/Read	A2	I	When MSyncMode is asserted high, this pin is a read/write control pin. In this mode, when MW/R is asserted high, a write access is enabled and the MicroData[7:0] pin values will be written to the memory location indicated by the MicroAddr[10:0] pins. Also, when MW/R is asserted low in this mode, a read access is enabled and the memory location indicated by the MicroAddr[10:0] pins is read. Its value is placed on the MicroData[7:0] pins. Both read and write accesses assume the device is chip selected (MCS* = 0), the address is valid (MAS* = 0), and the device is not being reset (Reset* = 1). When MSyncMode is asserted low, this pin is a read control pin. In this mode, when MRd* is asserted low, a read access is enabled and the memory location indicated by the MicroAddr[10:0] pins is read. Its value is placed on the MicroData[7:0] pins.
	MCS*	Microprocessor Chip Select	B2	I	When asserted low, the device is selected for read and write accesses. When asserted high, the device will not respond to input signal transitions on MicroClk, MW/R, MRd*, or MAS*, MWr*. Additionally, when MCS* is asserted high, the MicroData[7:0] pins are in a high-impedance state but the MicroInt* pin remains operational.

Table 2-5. CX28229 Pin Descriptions (2 of 12)

	Pin Label	Signal Name	No.	I/O	Description
Micro Interface	MAS*, MWr*	Microprocessor Address Strobe	A1	I	When MSyncMode is asserted high, this pin is an address strobe pin. When the MAS* pin is asserted low, it indicates a valid address, MicroAddr[10:0]. This signal is used to qualify read and write accesses. When MSyncMode is asserted low, this pin is a write control pin. When MWr* is asserted low, a write access is enabled and the MicroData[7:0] pin values will be written to the memory location indicated by the MicroAddr[10:0] pins. The write access assumes the device is chip selected (MCS* = 0), a read access is not being requested (MRd* = 1), and the device is not being reset (Reset* = 1).
	MicroAddr[0]	Microprocessor Address Bus	B1	I	These 11 bits are an address input for identifying the register to access.
	MicroAddr[1]		C2		
	MicroAddr[2]		E4		
	MicroAddr[3]		D2		
	MicroAddr[4]		C1		
	MicroAddr[5]		D1		
	MicroAddr[6]		E3		
	MicroAddr[7]		F4		
	MicroAddr[8]		E2		
	MicroAddr[9]		E1		
	MicroAddr[10]		M4		
	MicroData[0]	Microprocessor Data Bus	N3	I/O	A bi-directional data bus for reading and writing data to internal registers.
	MicroData[1]		N4		
	MicroData[2]		N1		
	MicroData[3]		N2		
	MicroData[4]		P2		
	MicroData[5]		P1		
	MicroData[6]		R1		
	MicroData[7]		R2		
	MicroInt*	Microprocessor Interrupt Request	T1	O	When active low, the device needs servicing. It remains active until the pending interrupt is processed by the Interrupt Service Routine. This pin is an open drain output for an external wired OR logic implementation. An external pull-up resistor is required for this pin.

Table 2-5. CX28229 Pin Descriptions (3 of 12)

	Pin Label	Signal Name	No.	I/O	Description
Micro Interface	MRdy	Microprocessor Ready	T2	O	When active high, the current read or write transaction has been completed. For a read transaction, the data is ready to be transferred to the microprocessor. For a write transaction, the data provided by the microprocessor has been written. This pin is an open drain output for an external wired OR logic implementation. An external pull-up resistor is required for this pin.
	MicroClk	Microprocessor Clock	R3	I	An 8–50 MHz clock signal input. The device samples the microprocessor interface pins (MCS*, MW/R, MAS*, MicroAddr[10:0], and Microdata[7:0]) on the rising edge of this signal. The microprocessor interface output pins (Microdata[7:0], MicroInt*) are clocked on the rising edge of MicroClk. Note that this clock is required for both synchronous and asynchronous operations. See note in Section 6.1.
External Memory	ExtMemSel	External Memory Enable	C13	I/PD	When this pin is pulled high, it enables the external differential delay SRAM bus.
	MemData[0]	Differential Delay Memory Data Bus	T5	I/O/PD	Differential delay SRAM Data Bus. ATM cells extracted from the Receive data stream are stored in the SRAM for the purpose of differential delay compensation. This bus is enabled by pulling the ExtMemSel pin high.

	MemAddr[19]		P3		
	MemCtrl_CE*	Chip Enable	L3	O	Receive SRAM Device Select (active low) control signal. This signal is enabled by pulling the ExtMemSel pin high.
	MemCtrl_OE*	Output Enable	L4	O	Receive SRAM Device Output (active low) control signal. This signal is enabled by pulling the ExtMemSel pin high.
	MemCtrl_WE*	Write Enable	L1	O	Receive SRAM write enable (active low) control signal. This signal is enabled by pulling the ExtMemSel pin high.
	MemCtrl_CLK	SRAM Clock	L2	O	Receive SRAM clock signal. This signal is enabled by pulling the ExtMemSel pin high.
External Memory	MemCtrl_ADSC	Address Enable	M3	O	Receive SRAM address enable (active low) address strobe. This signal is enabled by pulling the ExtMemSel pin high.

Table 2-5. CX28229 Pin Descriptions (5 of 12)

	Pin Label	Signal Name	No.	I/O	Description
JTAG	TRST*	Test Reset	E13	I/PU	When asserted, the internal boundary-scan logic is reset. This pin has a pull-up resistor. Do not assert this reset unless a clock is provided on TCK.
	TCK	Test Clock	F13	I	Samples the value of TMS and TDI on its rising edge to control the boundary scan operations.
	TMS	Test Mode Select	E14	I/PU	Controls the boundary-scan Test Access Port (TAP) controller operation. This pin has a pull-up resistor.
	TDI	Test Data Input	F16	I/PU	The serial test data input. This pin has a pull-up resistor.
	TDO	Test Data Output	F15	O	The serial test data output.
Factory Test	TestEnable		T3	I	Factory test use only, tie to VSS.
	TestMode		T4	I	Factory test use only, tie to VSS.
PHY Side Interface	PhyIntFcSel	PHY Interface Select	R4	I	If this pin is tied low, the PHY UTOPIA Interface mode is selected. If this pin is tied high, the PHY Serial mode is selected (as shown in this table).
	phyURxEnb[1]*	PHY UTOPIA Receive Enable	NC	O	This pin is a No Connect when PhyIntFcSel is tied high.
	phyUTxAddr[0]	PHY UTOPIA Transmit Address	NC	O	These pins are a No Connect when PhyIntFcSel is tied high.
	phyUTxAddr[3]		NC		
	phyUTxAddr[4]		NC		
	phyUTxEnb[0]*	PHY UTOPIA Transmit Enable	NC	O	These pins are a No Connect when PhyIntFcSel is tied high.
	phyUTxEnb[1]*		NC		
IMA Clocks	IMA_SysClk	IMA Subsystem Clock	M16	I	Most of the IMA logic circuits use this clock (or a derivative of it). It can also be used as a T1/E1 reference clock. Refer to Chapter 3.
	IMA_RefClk	IMA Subsystem Clock	L14	I	If Ref_Xclk is to be used as a reference clock, set the frequency as shown in Chapter 3.
	TxTRL[0]	Transmit Reference Clock	P4	O	Transmit Reference Clocks.
	TxTRL[1]		A3		

Table 2-5. CX28229 Pin Descriptions (6 of 12)

	Pin Label	Signal Name	No.	I/O	Description
Power Supply	V_{SS} GND	Ground	G7 G8 G9 G10 H7 H8 H9 H10 J7 J8 J9 J10 K7 K8 K9 K10		Ground connections.
	VGG	Electrostatic Discharge (ESD) Supply Voltage	B3		Provides ESD protection when interfacing with 5 V systems. If using this device in a system with 5 V logic, this pin must be connected to 5 V. If using 3.3 V system, connect to 3.3 V.

FOOTNOTE:
[1] This bus is enabled by pulling the ExtMemSel pin high. External Memory is disabled on the CX28224 and CX28225 versions of the device.

2.4 Stand Alone Cell Delineation

Figure 2-7 is an example of a non-IMA application. The CX28229 is being used as a stand alone Cell Delineator. Cell Delineation is performed internally and the CX2822x interfaces directly to the framers. These framers could be T1/E1 or DSL.

NOTE:	Most applications would use the less expensive RS8228 or M28228 Cell delineator. However, there may be applications that require the flexibility of the CX28229. This mode is also useful for troubleshoot during development since the IMA software drivers are not required. Configuration information is shown in Table 2-6.

Figure 2-7.   Non-IMA Application
500027_070

Table 2-6.   Cell Delineation Configuration Information

ATMMux [7,6] (ATMINTFC, 0x202)	PhyIntFcSel (Pin R4)	Description
10	High	TC Block Direct; Device used as Stand-alone cell delineator with 8 serial ports; IMA block not used.

2.5 Source Loopback (UTOPIA-to-Serial Configuration Only)

Source loopback checks that the host (the ATM layer) is communicating with the PHY. It is enabled and disabled in bit 5 of the PMODE register (0x04). When source loopback is enabled for a given port, all data transmitted by the CX2822x on that port is also looped back through the Receive Line Interface. Data from the framer interface is ignored.

NOTE: During Source loopback, the port is automatically placed in General Purpose mode and MicroClk used as the clock to loop back cells. As a result of the automatic mode switch and clock used, the data on the Tx serial lines will be corrupted.

Figure 2-8.   Source Loopback Diagram (This only shows the TC Block. IMA Block in pass-through mode.)
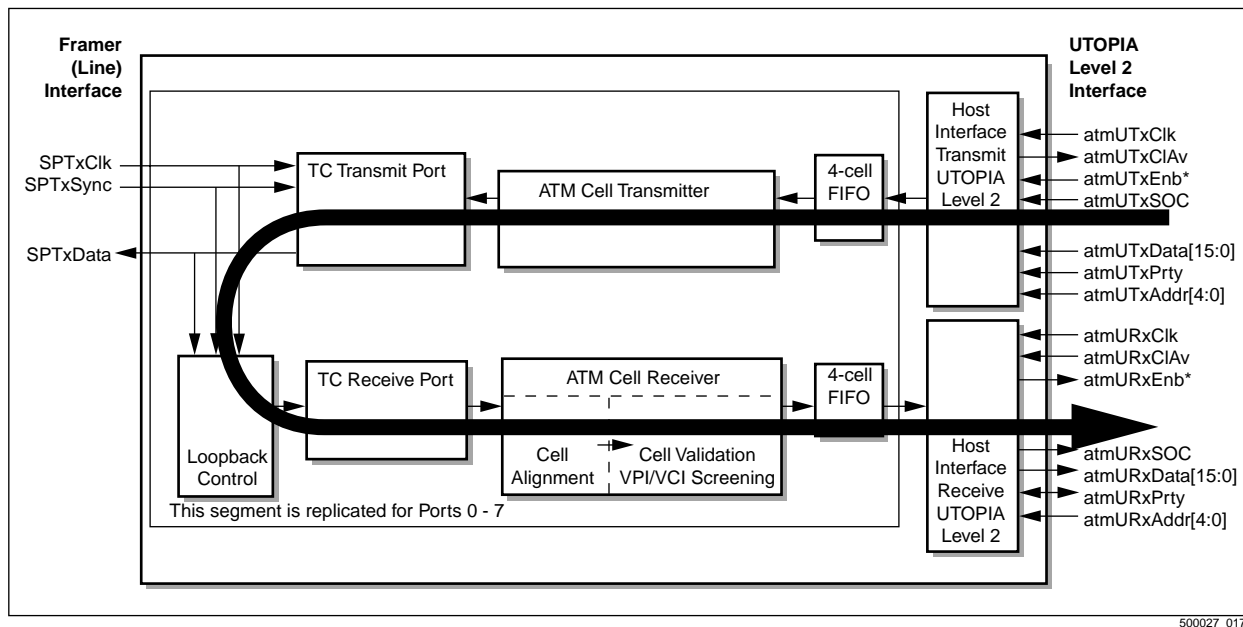

2.6   Far-End Line Loopback (Serial Configuration Only)

Far-End Line loopback verifies Line interface is communicating with the PHY. It is enabled by bit 4 of the PMODE register (0x04). When line loopback is enabled for a given port, all data received by the CX2822x on that port is processed by the Receive Line Interface and transmitted out the line interface. Data from the Transmit UTOPIA bus is ignored.

NOTE: SPTxClk, SPRxClk, SPTxSync, and SPRxSync must be present for the loopback mode to function properly for a given port.

Figure 2-9.   Far-End Line Loopback (This only shows the TC Block.)

General Note:
Configuring a port for line loopback mode disables all UTOPIA signals for that port.
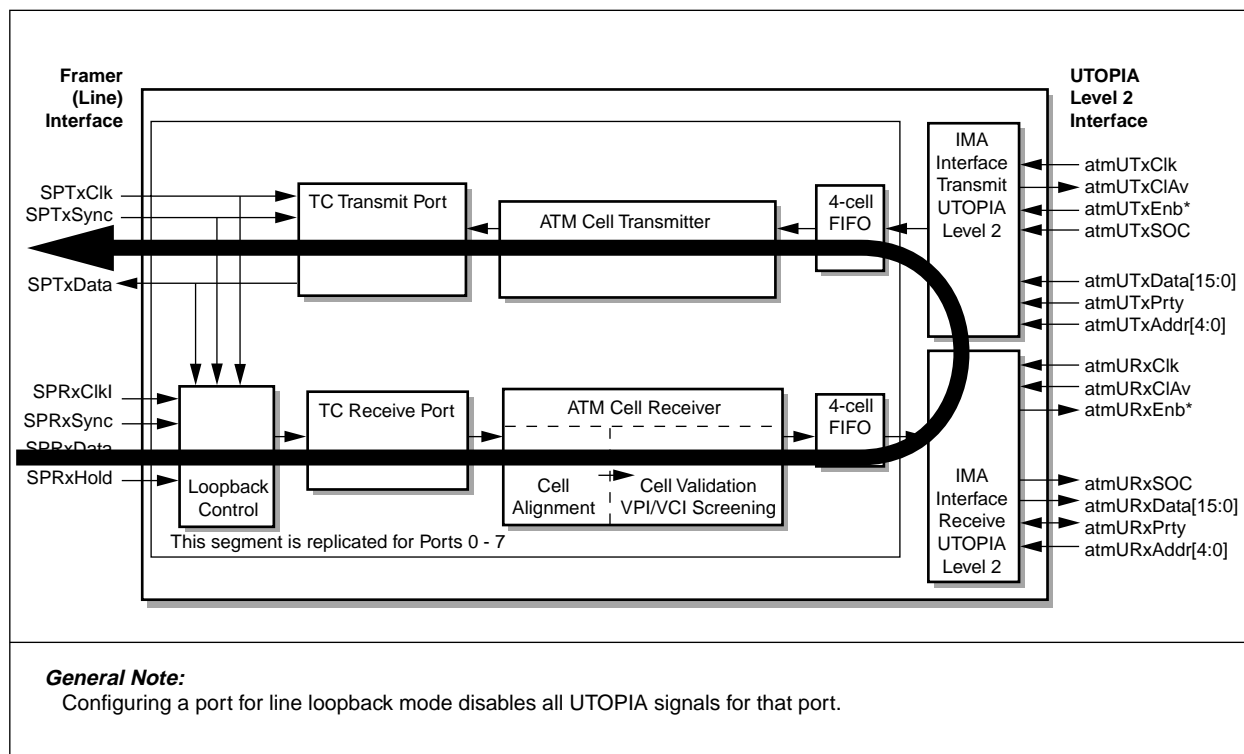

500027_058

2.7   Application Overview

The CX2822x is typically used with line framer devices like the CX28398 T1/E1 octal transceiver, the Bt8970 Zip Wire or the CX28398 HDLC Framer. Figure 2-10 illustrates a typical application.

Figure 2-10. CX2822x Connected to a CX28398 Transceiver

IMA Clocks

In order to maintain transmit frame synchronization the IMA engine must know the exact cell rate of each group. This is provided by the Transmit IMA Data Cell Rate clock (Tx IDCR). In addition, to operate the Receive Cell Smoothing buffer the device must know the Receive IMA Data Cell Rate (Rx IDCR). There is a Tx IDCR and Rx IDCR for each of the 16 groups that the CX29229 supports.

The CX29229 provides for tremendous flexibility with regard to these clocks. An oveview of the clocking circuitry is shown in Figure 3-1. While this can appear to be overwhelming at first glance, most applications are actually quite straightforward. The situation is also simplified by the software driver; it will calculate and program most of the control registers automatically. The hardware designer only needs to ensure that the proper clocks are available for the architecture desired.

In addition, two clock outputs are also provided: Tx_TRL[1] and Tx_TRL[0]. These can be used to output one of the reference clock inputs or generate an 8 kHz reference that is phase locked to IMA_SysClk or IMA_RefClk (whichever is used as a timing reference).

The IDCR Clocks can be derived from one of four input sources:

1. IMA_SysClk: This is the primary IMA system clock and is used by most of the internal IMA logic. It is also used to generate the PHY side UTOPIA Rx and Tx clocks (phyURxClk and phyUTxClk).

2. IMA_RefClk: This is used with applications where multiple Transmit references are available and/or when it is possible or necessary to run asynchronously relative to IMA_SysClk. This signal is either a line or payload rate reference clock or is a high speed (n x 8 kHz) reference clock from which nominal Transmit and Receive payload rates can be derived.

3. Receive bit clock: When operating in the UTOPIA-to-Serial mode the CX2822x can select any of the Rx bit clocks to use as the reference clock. The receive direction timing is used for recovering the IMA frame rate of the received IMA group. Using this option for the Transmit IMA group frame rate results in a 'line timed' configuration.

4. phyURxClAv: This is the PHY side UTOPIA Rx Cell Available signal, which tracks the actual cell data rate being transferred from an individual port. Internal synthesizers can use this signal in place of the serial Rx bit clocks to derive the payload rate for each Receive port. The receive direction timing is used for recovering the IMA frame rate of the received IMA group. Using this option for the Transmit IMA group frame rate results in a 'line timed' configuration.

Figure 3-1 shows the details of the CX28229's IMA clock block from Figure 1-1. This block is responsible for generating all clocks required by the IMA engine. It can be further divided into 8 sections, as shown in Table 3-1:

Table 3-1. IMA Block Clock Sections

Clock Section	Description
Serial Port Synchronizer	This block contains a transition detector and a synchronizer. It synchronizes the clocks from the TC block Serial ports to the IMA_SysClk divided by 16. It handles all 8 internal serial ports independently.
IMA_SysClk Dividers	This block contains two dividers: a divide by 16 and a divide by 24. The divide_16 is used to synchronize external clocks to internal logic. The divide_24 allows the IMA_SysClk to be used to generate both the Rx IDCR and the Tx IDCR clocks (provided that IMA_SysClk is 24 times the bit rate).
IMA_RefClk Synchronizer	This block contains a transition detector and a synchronizer. It synchronizes the IMA_RefClk to the IMA_SysClk divided by 16.
IDCR Source Mux	This software controlled mux selects which clock sources are feed to the appropriate IDCR clock dividers.
Rx IDCR Clock	This block divides the bit rate clock down to a link cell data rate clock based on the values of frame length (M), number of links in the group (N), frame payload (P) and frame bit (F). (The 2048/2049 factor results from the IMA standards requirement of inserting a stuff event every 2048 cells.) This block can generate 16 independent Rx IDCR clock outputs (one per group).
Tx IDCR Clock	This block divides the bit rate clock down to a Link cell data rate clock based on the values of frame length (M), number of links in the group (N), frame payload (P) and frame bit (F). (The 2048/2049 factor results from the IMA standards requirement of inserting a stuff event every 2048 cells.) This block can generate 16 independent Rx IDCR clock outputs (one per group).
Bit Rate Clock Generator	This block generates a clock that represents the link data rate. It can generate 16 independent Tx and 16 independent Rx clocks. In normal operation, all parameters are configured automatically by the software driver. It contains the following blocks: • Pre-scaler—This block divides the selected input (either IMA_RefClk or IMA_SysClk) by the factor of Pnum divided by Pden. • Synchronizer—Synchronizes the Pre-Scaler output to the internal logic using the IMA_SysClk divided by 16. • Numerically Controlled Oscillator—This clock circuit generates the link bit rate.
Digital Phase Locked Loop	This block generates a bit rate clock that is phase locked to the PHY side RxClAv signal. It can monitor all 32 ports on the bus. Any port can be selected as the group timing reference.

Figure 3-1.   CX28229 Clock Diagram
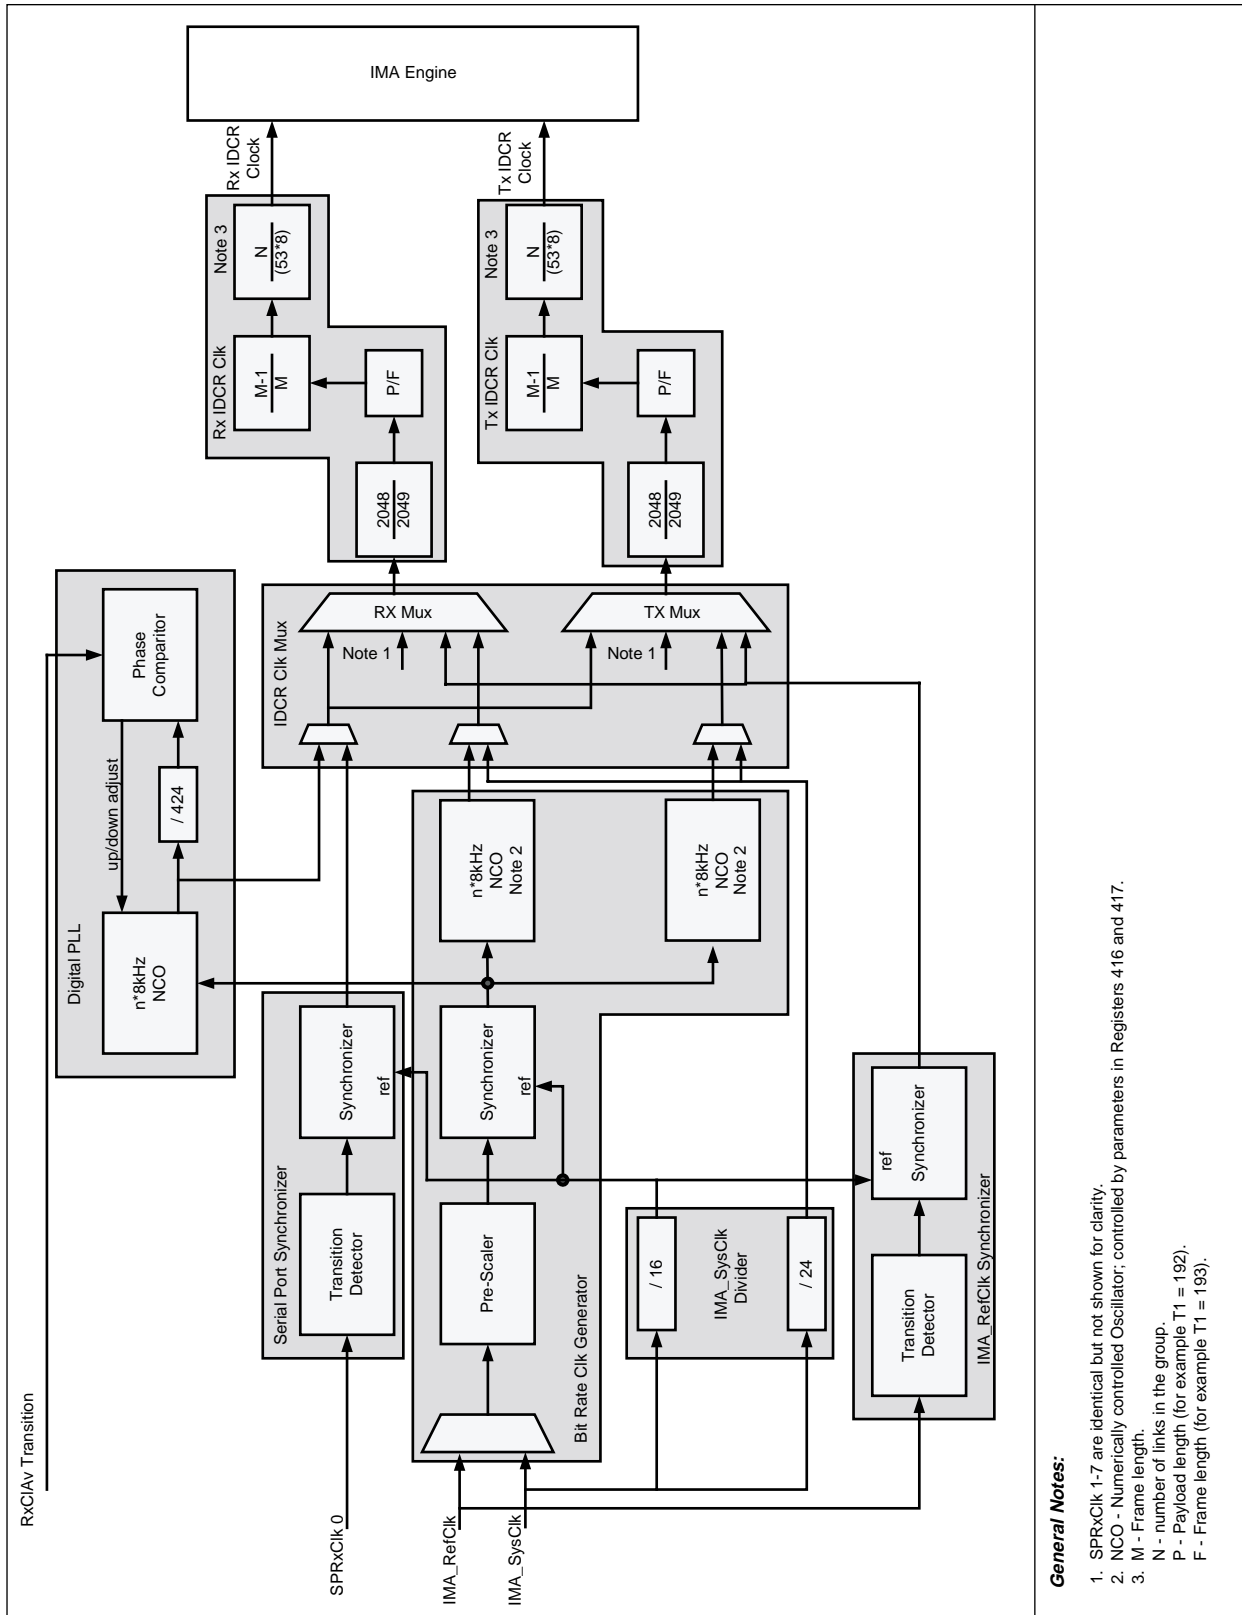

500027_072

3.1 Common Applications

The solution for high port count and variable rate DSL applications is to use internal counters and frequency synthesizers referenced from a common (n x 8 kHz) clock input with feedback from the cell available signal from the PHY side UTOPIA bus.

For low port count, single rate applications that take advantage of the embedded ATM Cell Processor, the use of receive bit clock inputs is the most straight-forward solution.

Several of the most common applications follow.

3.1.1 T1/E1 Using Internal Serial Ports

3.1.1.1 Using IMA_SysClk as the Transmit Clock

Figure 3-2 illustrates T1/E1 with internal serial ports, using IMA_SysClk equal to 24 times the line rate. This is one of the simplest implementation of IMA when a clock equal to 24 times the line rate is available. Several issues are worth noting:

◆ The IMA_RefClk input is unused and should be tied to ground. The CX28229 is deriving all required clocks from the Serial port clocks and the IMA_SysClk.

◆ The IMA_SysClk is used to synchronize the SPRxClk inputs to internal logic (via the divide by 16 block).

◆ The SPRxClk is being used to generate the Rx IDCR clock. Also note that the receive clock from any link within a group could be used to generate the Rx IDCR for that group.

◆ The IMA_SysClk is being used to derive the TX IDCR clock.

The device is configured using a software driver. The following code is an example of calls to the driver:

```
IMA_LINK_TYPE = IMA_DS1
IMA_DSL_USE_REF_CLK2 = IMA_INACTIVE
IMA_DSL_REF_GENERATOR = IMA_INACTIVE
IMA_ALT_RX_TRL = IMA_INACTIVE
IMA_GRP_TX_TRL_SRC = IMA_REF_XCLK (grp#)
IMA_GRP_RX_TRL_SRC = IMA_RX_TRL_(x) (grp#)
```

Figure 3-2.   T1/E1 using Internal Serial ports; IMA_SysClk equals 24x line rate

General Note:

1. SPRxClk 1-7 are identical but not shown for clarity.
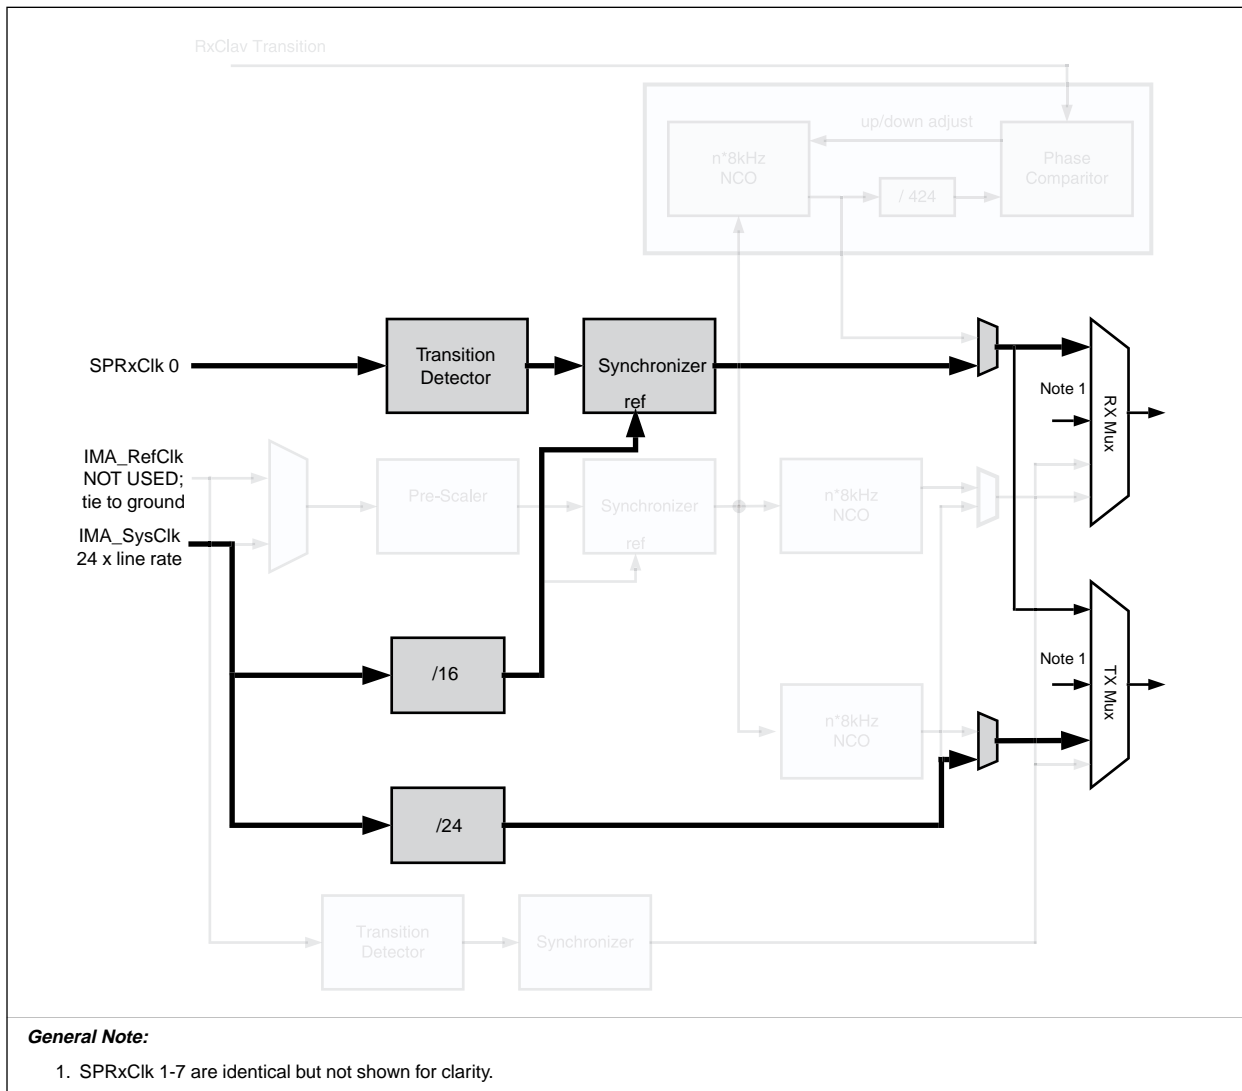

500027_073

3.1.1.2   Using IMA_RefClk as the Transmit Clock

Figure 3-3 illustrates T1/E1 with internal serial ports, using IMA_RefClk. There are several important differences from the first example:

◆ In this case, IMA_SysClk is only used by internal logic. It must be greater than or equal to 22 times the line rate to ensure that internal logic can keep up with the data.

◆ Again, the SPRxClk is used to generate the RxIDCR clock.

◆ The TX IDCR clocks are generated from the IMA_RefClk. Thus IMA_RefClk must equal 1.544, 1.536, 2.028, or 1.920 MHz depending of the frame format used.

The device is configured using a software driver. The following code is an example of calls to the driver:

```
IMA_LINK_TYPE = IMA_DS1
IMA_DSL_USE_REF_CLK2 = IMA_INACTIVE
IMA_DSL_REF_GENERATOR = IMA_INACTIVE
IMA_ALT_RX_TRL = IMA_INACTIVE
IMA_GRP_TX_TRL_SRC = IMA_REF_CLK1 (grp#)
IMA_GRP_RX_TRL_SRC = IMA_RX_TRL_(x) (grp#)
```

Figure 3-3.   T1/E1 using Internal Serial ports; IMA_RefClk equals line rate

General Note:

1. SPRxClk 1-7 are identical but not shown for clarity.
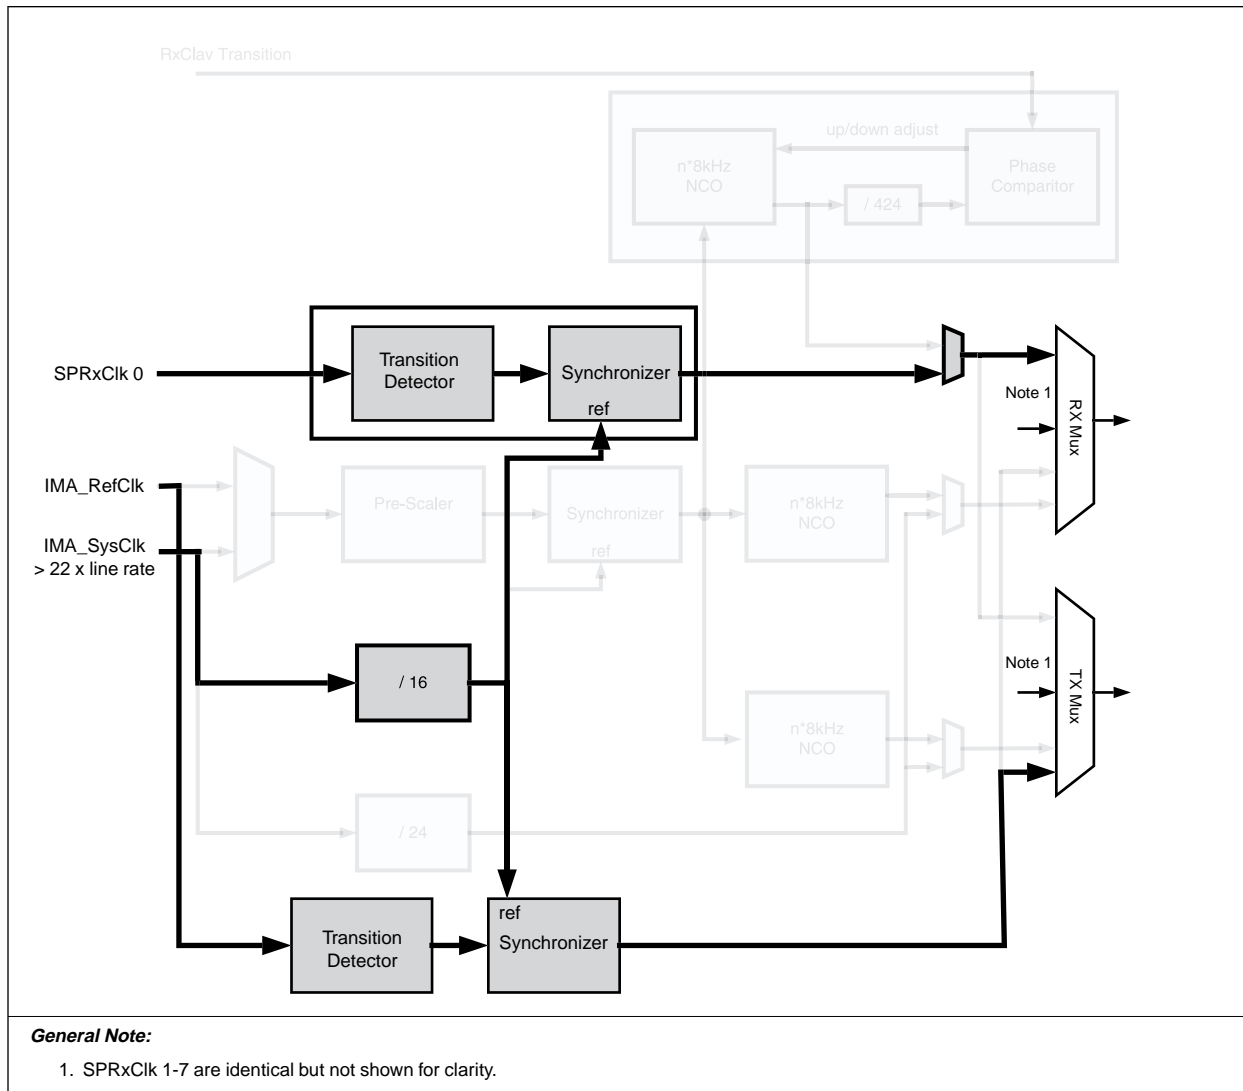

500027_074

3.1.2   DSL/T1/E1 Using UTOPIA-to-UTOPIA Interfaces

Figure 3-4 illustrates the configuration most commonly used with applications that require more than 8 ports. Up to 32 links and 16 groups can be supported using external Cell Delineators such as the RS8228.

- ◆ The Rx IDCR clock is synthesized using the RxClAv input from the PHY side UTPOIA bus. This is performed on a per group basis; that is, one link in each group is selected (via software) to provide the Rx IDCR for that group.
- ◆ IMA_SysClk must be greater than or equal to 40.96 MHz (less than 24 ports) and be greater than or equal to 49.152 MHz if there are more than 24 ports.
- ◆ Either IMA_SysClk or IMA_RefClk can be used as the Tx IDCR clock:
  - • IMA_SysClk may be used if it is an 8 kHz multiple of the bit rate.
  - • IMA_RefClk may be used if it is an 8 kHz multiple of the bit rate and greater than or equal to 4.64 MHz.

The device is configured using a software driver. The following code is an example of calls to the driver:

```
IMA_LINK_TYPE = IMA_VAR_RATE
IMA_DSL_REF_CLK_FREQUENCY = 40960000
IMA_DSL_USE_REF_CLK2 = IMA_INACTIVE
IMA_DSL_REF_GENERATOR = IMA_ACTIVE
IMA_ALT_RX_TRL = IMA_ACTIVE
IMA_GRP_LINK_BANDWIDTH = 2304 (grp#)
IMA_GRP_CLK_REF_FACTOR = IMA_NO_DIV (grp#)
IMA_GRP_TX_TRL_SRC = IMA_REF_XCLK (grp#)
IMA_GRP_RX_TRL_SRC = IMA_RX_TRL_(x) (grp#)
```

Figure 3-4.   DSL—UTOPIA-to-UTOPIA

4
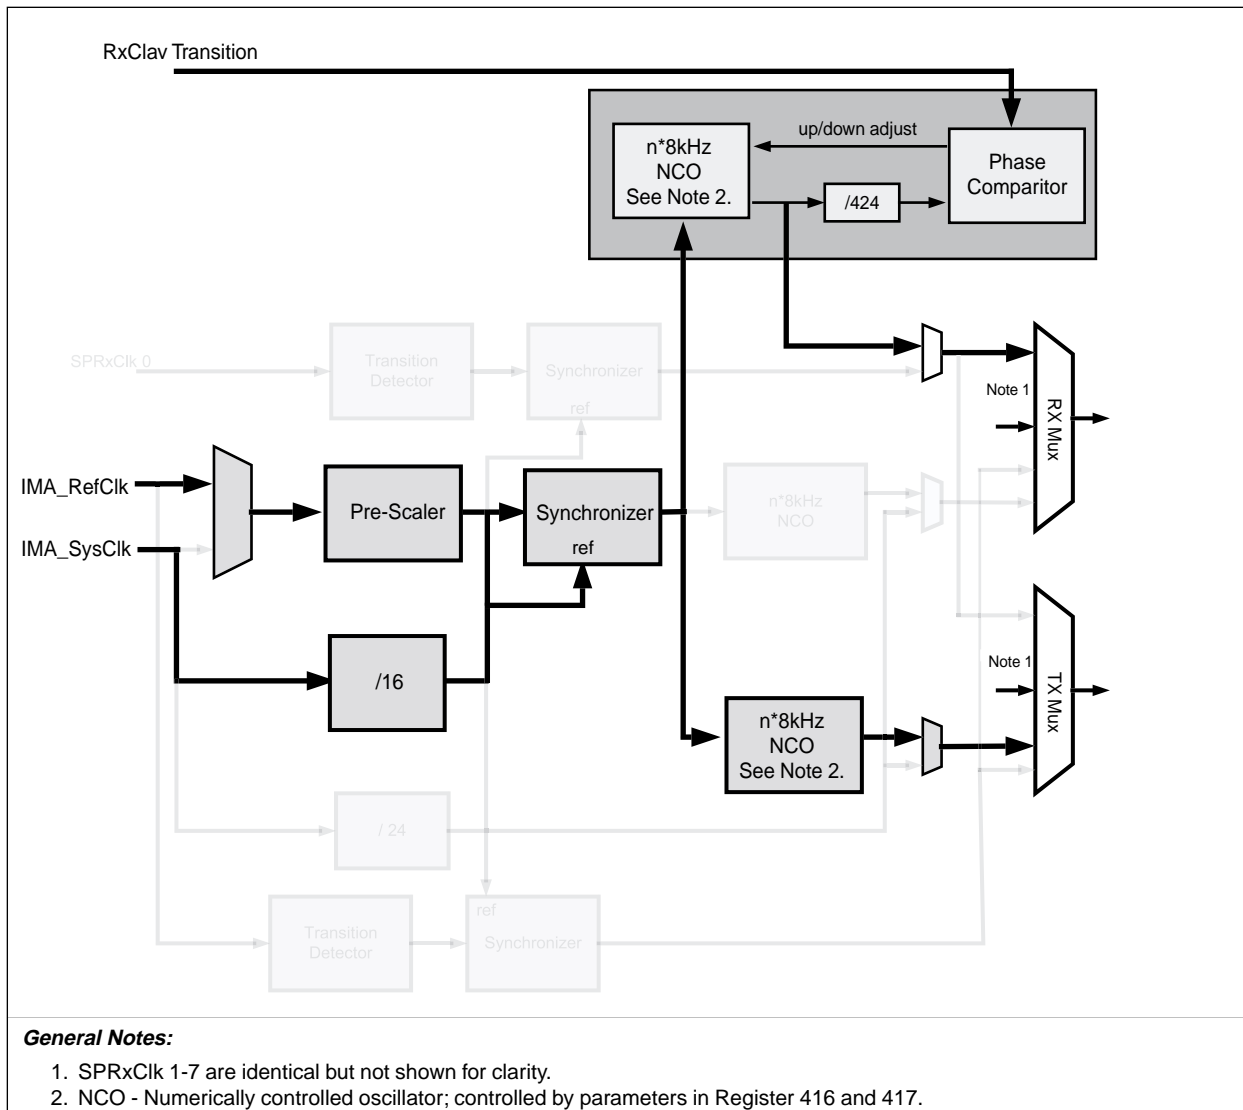

UTOPIA Interfaces

The CX2822x supports multi-PHY operation as described in the UTOPIA Level specification (AF-PHY-0039.000, see www.atmforum.com). This standard allows up to 31 ports to interface to one ATM layer device. The interface uses either 8-bit or 16-bit wide data buses, and cell-level handshaking. The 16-bit mode, which can run at 50 MHz, supports data rates up to 800 Mbps. The Cx2822x implementation does not support octet level handshaking or UTOPIA parity.

Each of the CX2822x's UTOPIA blocks has two sections, transmit and receive, each of which has a 4-cell FIFO buffer. ATM cell data is placed in the transmit FIFOs where it can then be passed to the ATM cell processing block. On the receive side of the UTOPIA interface, incoming cells are placed in the receive FIFO until sent.

With regard to IMA, each IMA group is considered one logical port and will only take up one UTOPIA address. For example, a group with 8 T1 links could be assigned to address 0; the IMA engine handles the translation between the ATM layer and the physical links. In addition, each pass-though connection also requires one address.

NOTE: By convention, data being transferred from the PHY to the ATM layer is considered received data, while data from the ATM layer to the PHY is called transmitted data.

To provide maximum flexibility for system design the CX28229 has 3 UTOPIA Level 2 interfaces. This allows the CX28229 to be used in either UTOPIA-to-UTOPIA or UTOPIA-to-Serial IMA applications or it can function as a stand-alone cell delineator block. These interfaces are shown in Figure 4-1 and described below.

1. IMA direct—This interface allows the ATM layer to interface directly to the IMA engine. This would be the normal mode for all IMA applications. It is controlled by registers in the IMA section.
2. TC block direct—This interface is selected when the IMA engine is disabled and the device is being used as a stand-alone cell delineator. It may also be invoked during troubleshooting to verify serial port operation without having to run the IMA drivers. It is configured by registers in the TC section.
3. PHY side UTOPIA—This interface is selected when the TC block is disabled and the designer wishes to interface to a device via an UTOPIA interface. This allows the CX28229 IMA engine to address up to 32 ports on the line side.

4.1   General UTOPIA Operation

Three primary functions are performed by the UTOPIA controller: polling, selection, and data transfer. These functions are basically the same for both the transmit and receive sides of the UTOPIA bus. The following example describes the transmit functions. Refer to Figure 4-1.

The ATM layer UTOPIA controller polls the connected PHY ports by transmitting the port addresses on the UTxAddr lines. If a port is ready to transfer data, it asserts UTxClAv. Note that the process of polling a port does NOT result in that port being selected to transfer data! Polling allows the controller to determine which port is ready for data; it must then select that port before sending data. It does so by reasserting the desired address and then asserting UtxEnb*. The PHY will then be ready to transfer data on the UTxData lines. UTxEnb* is deasserted when the transfer is completed. Polling can continue during the data transfer process but not during port selection. It operates independently of the state of UTxEnb*.

To pause the data transfer, UTxEnb* can be deasserted. To continue the transfer, the controller must reselect the port by transmitting its address one clock cycle before asserting UTxEnb*. The controller must ensure that the cell transfer from this port has been completed, to avoid a start-of-cell error.

4.2   UTOPIA 8-bit and 16-bit Bus Widths

The CX2822x has two bus width options, 8-bit or 16-bit, which are selected in BusWidth, bit 2, of the MODE register (0x0202). The protocols and timing are the same in both modes, except that 8-bit mode uses only the lower half of the data bus (TxData[7:0] and RxData[7:0]) and parity is only generated or checked over those bits. UTOPIA Level 2 8-bit operates up to 33 MHz and Level 2 16-bit up to 50MHz.

NOTE: CX28224 only supports 8 bit UTOPIA.

In 8-bit mode, each ATM cell consists of 53 bytes, as listed in Table 10-8. The first five bytes are used for header information. The remaining bytes are used for payload.

In 16-bit mode, the cell consists of 54 bytes, as listed in Table 10-9. The first five bytes contain header information. The sixth byte, UDF2, is required to maintain alignment but is not read by the CX2822x. The remaining bytes are used for payload.

4.3 IMA UTOPIA

This is the normal interface for IMA applications and is selected as shown in Table 4-1.

It is intended to interface to a single ATM Layer device and appear as a multi-port PHY device. Figure 4-1 illustrates the connections to/from the ATM Layer device. The number of "ports" or channels on the IMA Subsystem is the sum of the number of configured IMA groups plus the number of pass-through facilities. The IMA CX28229 requires a unique Utopia address for each channel (IMA group or pass-through). There are no restrictions placed on the address assignment and not all 32 locations are normally used.

If only one channel is programmed, (a single IMA group and no pass-through facilities), then the CX28229 can be compatible with UTOPIA Level 1 by fixing the address lines to a specific value and setting the IMA group's ATM address (through the software driver) to that value.

The CX28229 provides numerous options to match non-standard UTOPIA controllers. See the IMA_ATM_UTOPIA_BUS_CTL register, 0x413, for more information.

NOTE: 0x1F can be assigned as a valid port address to enable 32 port bypass.

4.4 TC Block UTOPIA

This interface is selected when using the device as a stand-alone cell delineator. See Table 4-1 and Section 2.4. It interfaces to the ATM layer as a normal UTOPIA Level 2 interface with the following enhancements.

UDF2 Programmability

The user can program the contents of the UDF2 byte when operating in 16-bit UTOPIA mode. Be default, the contents of the UDF2 byte (detailed in Table 10-9) on the receive interface will match the default value of the UTOPIA port address. This can be changed by writing the desired value to the corresponding UDF2 control register, 0x0F. Bus width is controlled by bit 5 of the ATMINTFC register.

Port Number Assignment

The UTOPIA address for each port is stored in bits 0–4 of the UTOP2 register (0x0E). The default for this value is the port number. For example, the UTOP2 register for port 4 (0x10E [with the offset]) defaults to 04 hex. However, the value can be changed to any value from 00–1E hex by programming the register to accommodate multiple devices on the same UTOPIA bus. The value 1F hex is reserved for the null address. The UTOPIA address should be changed only when the device or port is in the reset state.

UTOPIA Receive Disable

The CX2822x has a UTOPIA receiver output disable feature which allows the user to set up redundant or back-up PHYs with the same UTOPIA address on the same UTOPIA bus. In this setup, both PHYs' transmitters are enabled, sending out identical data streams. Both PHYs' receivers are enabled, but only one is transferring data to the ATM device. The receiver output is disabled in the backup PHY by writing the UtopRxDis, bit 5, in the UTOP2 register (0x0E) to a logical 1. This disable places five of the backup PHY's signals, URxData, URxPrty, URxSOC, URxClAv, and UTxClAv, in a high-impedance state, preventing data and control signals from being passed to the ATM layer device. The disabled receiver will flush its FIFOs at the same rate as the enabled one, but all data it has received, except the last four cells, will be lost. Should the primary PHY device encounter an unacceptable error rate, software can quickly enable the backup PHY and disable the primary PHY, reducing cell loss in the transition.

HEC Override

In normal operation, the HEC is calculated by the TC layer and put in byte 5, UDF1. This may be overridden by setting bit 7 of the CGEN register (0x08) to a 1. In this case, data inserted by the ATM layer into byte 5 is transmitted unchanged by the device.

Table 4-1. Device Configuration Options

ATMMux [7,6] (ATMINTFC, 0x202)	PhyIntFcSel (Pin R4)	Description
01	Low	IMA UTOPIA using the PHY Side UTOPIA; UTOPIA-to-UTOPIA; TC block/serial ports not used.
01	High	IMA UTOPIA using Internal TC block; UTOPIA-to-Serial mode; 8 internal serial ports
10	High	TC only; Device used as Stand-alone cell delineator with 8 serial ports; IMA block not used.

4.5   PHY Side UTOPIA

An ATM forum compliant UTOPIA interface is provided for interfacing to PHY layer devices. Several unique features should be noted:

1. It is only UTOPIA level 2.

2. This bus only supports an 8 bit wide data path. This was done to simplify routing issues and reduce pin count.

3. The UTOPIA interface has a second set of control lines, which allow 32 addresses. These can be connected as shown in Figure 4-1. This effectively provides two buses with 16 devices each, all sharing common address and data lines but with separate control lines. (Remember, UTOPIA uses address 0x31 as the null address thus limiting the bus to 31 ports. However, the standard also allows for multiple ClAv and Enable lines.)

Figure 4-1.   CX28229 Multiple UTOPIA Control Lines

General Note:

Only the Transmit side is shown for clarity. The Receive side is identical.

Mindspeed Technologies™

5
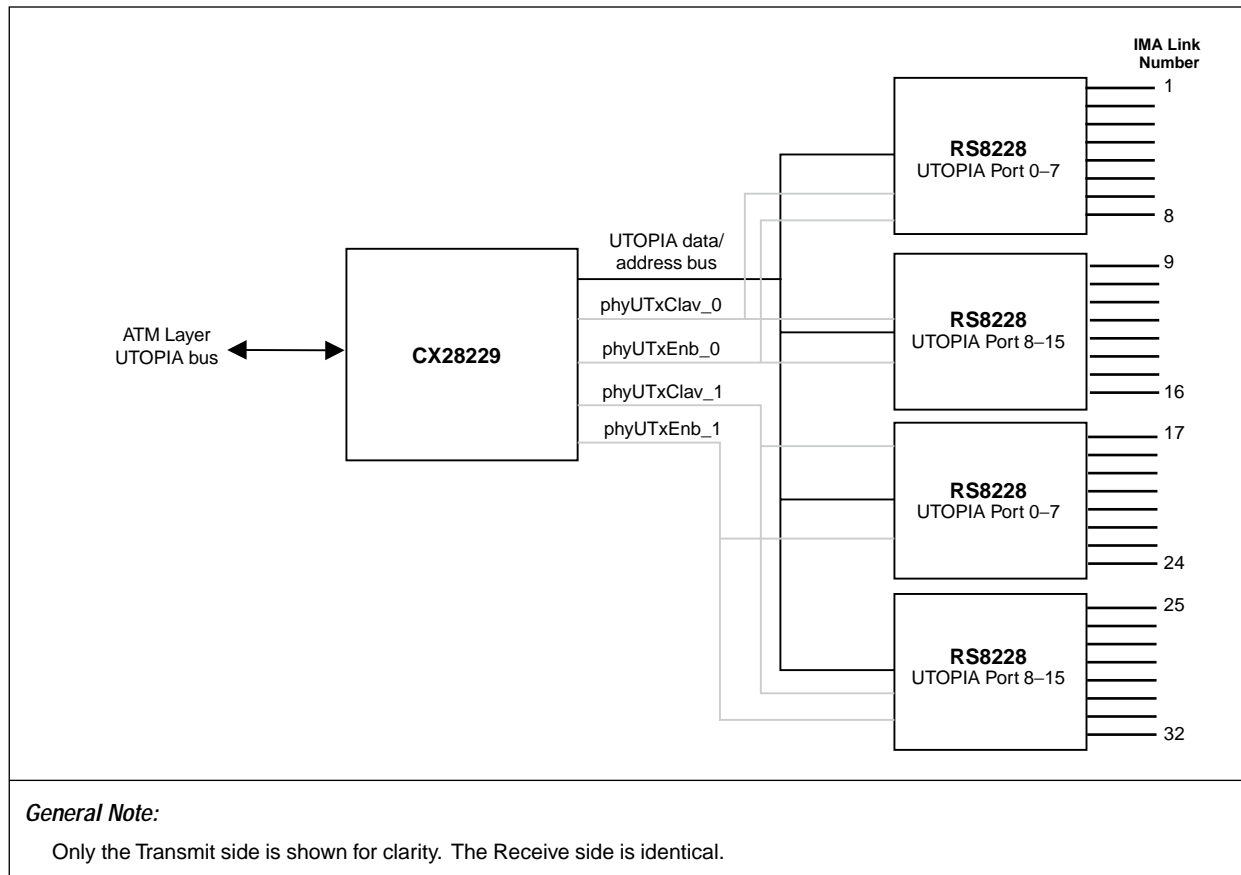

Transmission Convergence Block

The CX2822x's ATM Transmission Convergence (TC) block is responsible for recovering cell alignment using the HEC octet, performing detection/correction, and descrambling the payload octets. The resulting ATM cells are then passed to the ATM layer via the UTOPIA interface. Simultaneously, the ATM transmitter block is receiving data from the ATM layer, optionally inserting header fields, optionally calculating the HEC, and sending the cells to the framers. If no data is being received from the ATM layer, the cell processor generates idle cells based on the data programmed into the associated registers.

NOTE: When operating in the UTOPIA-to-UTOPIA mode, the ATM Cell processor block is disabled.

5.1   ATM Cell Transmitter

The ATM cell transmitter controls the generation and formatting of 53-octet ATM cells that are sent to the Framer (Line) Transmit Ports. This block formats an octet stream containing ATM data cells from the ATM layer device when those cells are available. All 53 octets of the data cells may be obtained from the external data source and formatted into the outgoing octet stream.

This block calculates the HEC octet in the outgoing cell from the header field. The calculated HEC octet can be inserted in place of the incoming data octet by writing DisHEC (bit 7) in the CGEN register (0x08) to a logic 0. For testing purposes, this HEC octet can be corrupted by XORing the calculated value with a specific error pattern input set in the ERRPAT register (0x0B). This HEC error is achieved by writing ErrHEC (bit 4) in the CGEN register (0x08) to a logic 1. The remaining 48-octet payload field of the outgoing cell is obtained from the external data source. The payload can be scrambled.

When there is no data from the ATM layer device, the TC Block inserts idle cells automatically in the outgoing octet stream. The 4-octet header field for these idle cells comes from the TXIDL1–4 registers (0x14–17). The HEC octet is calculated and inserted automatically. The payload field is filled with the octet contained in the IDLPAY register (0x0A).

In normal operation, the 4-octet header field in the outgoing cell is passed on from the ATM layer device. Header patterns can be modified in the TXHDR1–4 registers (0x10–13) and inserted into outgoing cells in place of header bytes received from the ATM layer. Whether the original header cells or replacement cells are sent is controlled by bits 0–4 in the HDRFIELD (0x09) register.

5.1.1   HEC Generation

In normal operation, the CX2822x calculates the HEC for the four header bytes of each cell coming from the ATM layer. It then adds the HEC coset (55 hex, by ATM standards) and inserts the result in octet 5 of the outgoing cell. HEC calculation can be disabled by setting bit 7 of CGEN (0x08) to a 1. When HEC is disabled, the CX2822x leaves the contents of the HEC field unchanged and transmits whatever data is placed in that field by the ATM layer.

The HEC coset is used to maintain a value other than zero in the HEC field. If the first four bytes in the header are zero, the HEC derived from these bytes is also zero. When this occurs and there are strings of zeros in the data, the receiver cannot determine cell boundaries. Therefore, it is recommended that the value 55 hex be added to the HEC before transmission. To enable the HEC coset on the transmit side, set bit 6 in register CGEN (0x08) to one. To enable the receive HEC coset, set bit 5 in register CVAL (0x0C) to one.

5.2   ATM Cell Receiver

The ATM cell receiver performs cell delineation on incoming data cells by searching for the position of a valid HEC field within the cell. The HEC coset can be either active or inactive; this is determined in bit 5 in the CVAL (0x0C) register.

Figure 5-1.   Details of the TC Block (Bits 7 and 6 in ATMINTFC, address 0x202)
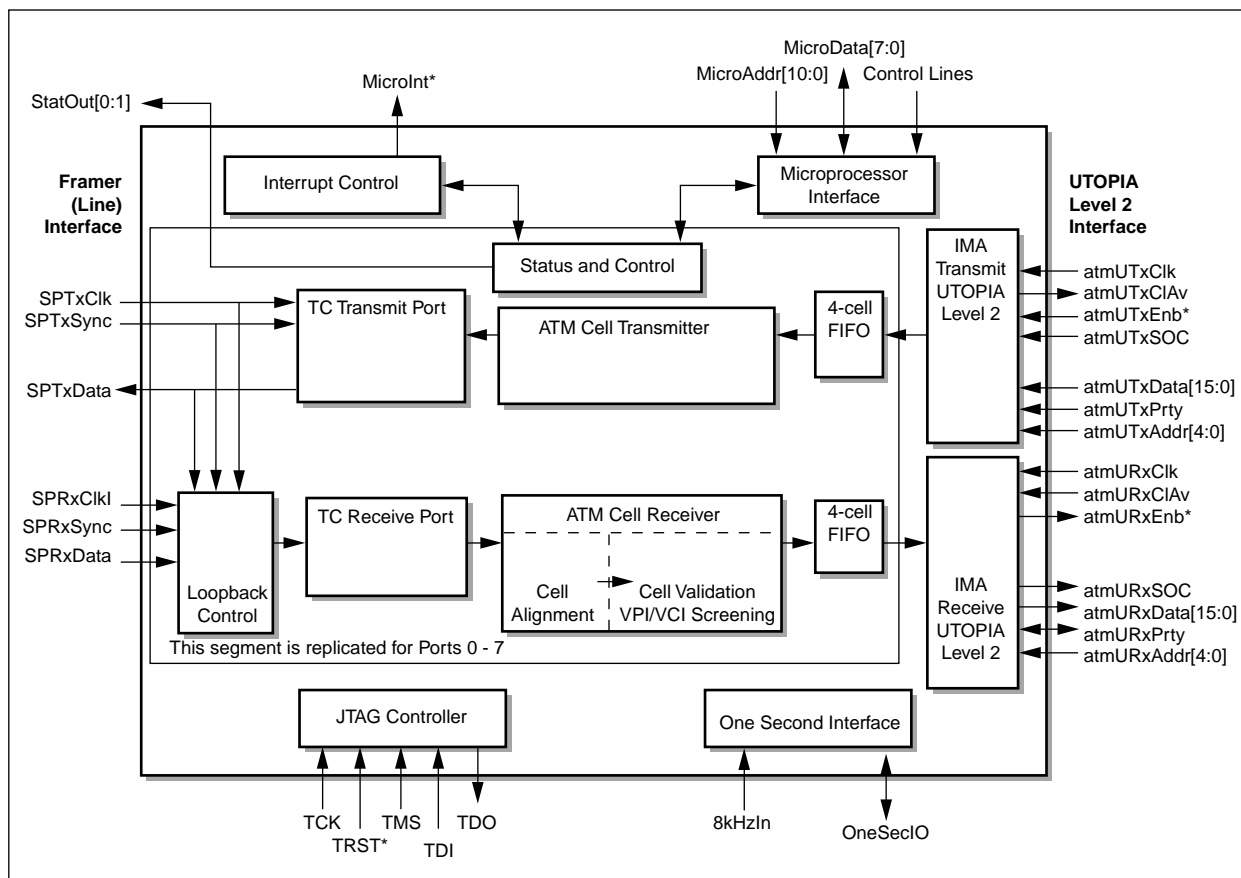

500027_063

5.2.1   Cell Delineation

The ATM block receives octets from the framers and recovers ATM cells by means of cell delineation. Cell delineation is achieved by aligning ATM cell boundaries using the HEC algorithm. Four consecutive bytes are chosen and the HEC value is calculated. The result is compared with the value of the following byte. This "hunt" is continued by shifting this four-byte window, one byte at a time, until the calculated HEC value equals the received HEC value. When this occurs, a pre-sync state is declared and the next 48 bytes are assumed to be payload. The ATM block calculates HEC on the four bytes following this payload, assuming that a new cell has begun. If seven consecutive header blocks are found, synchronization is declared. If any HEC calculation fails in the pre-sync state, the process begins again (see Figure 5-2). Synchronization will be held until seven consecutive incorrect HECs are received. At this time, the "hunt" state is reinitiated.

Figure 5-2.   Cell Delineation Process
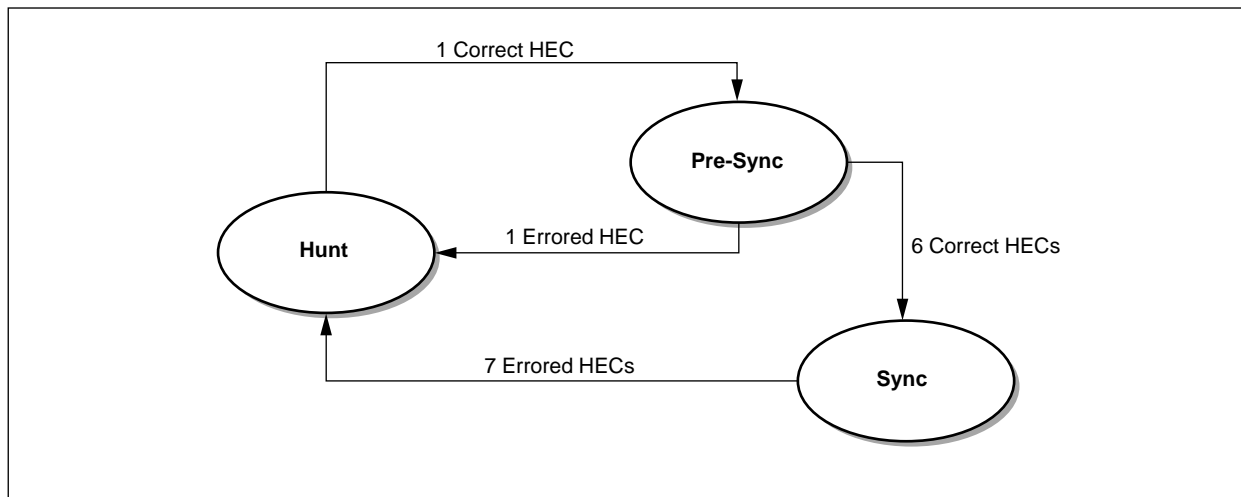

During the sync state of cell delineation, cells are passed to the UTOPIA interface if the HEC is valid. If a single-bit error in the header is detected, the error is corrected (optionally), and the cell is passed to the UTOPIA interface. If HEC checking is enabled and HEC correcting is disabled (bit 3 in the CVAL register [0x0C]), cells with single-bit HEC errors are discarded. If a multi-bit error is detected, the cell is dropped. Once either type of error is noted, all subsequent errored cells are dropped until a valid cell is received. This rule applies even for single-bit errors that could be corrected. Once a valid cell is detected, the process begins again. (See Figure 5-3.)

When loss-of-cell delineation (LOCD) occurs, an interrupt is generated and the CX2822x automatically enters the "hunt" mode. However, the cell is still being scrambled by the far-end transmitter, leaving only the headers (or just the HEC byte in Distributed Sample Scrambler [DSS]) unscrambled. This means that the only repetitive byte patterns in the data stream that meet the cell delineation criteria are valid headers (or just the HEC bytes in DSS).

Figure 5-3.   Header Error Check Process

500027_007
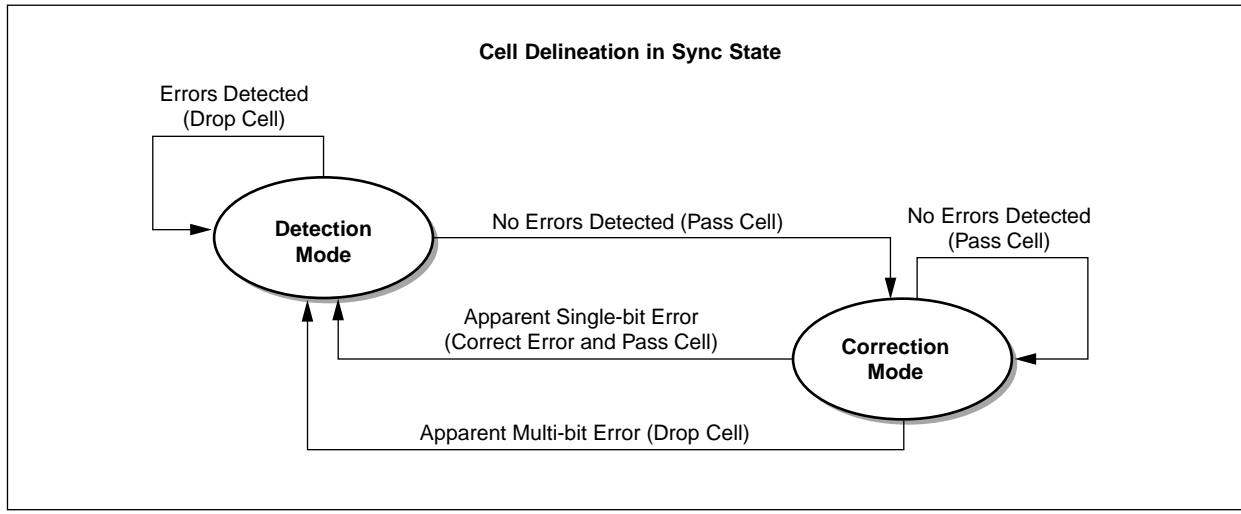

When the CX2822x is in general purpose mode, a synchronization pulse from the framer interface is not always available. In this mode, the CX2822x performs a bit serial search to find byte and cell alignment. The CX2822x selects a starting window of 32 sequential bits and calculates the HEC over this window. This HEC is then compared to the next eight incoming bits. If they do not match, the CX2822x shifts the 32-bit window by 1 bit and recalculates the HEC until a valid HEC position is found. Once byte-alignment is achieved, cell delineation is performed.

5.2.2   Processing Non-Standard Traffic Using the CX28229

The CX28229 contains two independent "HEC Check" state machines. The Cell Delineator (CD) State Machine is used to find Cell Delineation and, conversely, to declare loss of cell delineation (LOCD). The other is the Cell Valid (CV) State Machine, which is used to validate the cells to pass to the UTOPIA FIFOs.

These state machines are controlled by two register bits, (CVAL register, 0x0C), that allow the CX28229 to be programmed for special applications. Table 5-1 shows the control bits function.

Mindspeed Technologies™

Table 5-1. Control Bit Functions

DisLOCD	DisHECChk	Description
0	0	Normal operation; used for standard ATM traffic. Cells are output to the UTOPIA FIFO only after cell delineation is found. Only cells with valid HECs are passed (this includes cells with single bit errors that have been corrected).
0	1	Ignore HEC Errors Mode; used for IMA applications. The Cell Delineator state machine is active and looking for valid ATM cells. It will follow the ATM Forum's Cell Delineation process. However, since the Cell Valid State machine is turned off, the CX28229 will pass all cells, including those with HEC errors, to the UTOPIA FIFOs. The CX28229 will not transfer cells during LOCD.
1	0	The cell delineation function is disabled and every 53 bytes of incoming data is treated as a 'cell'. However, since the CV machine is still active, only cells with valid HECs will be output. As a result, almost all data will be dropped. Occasionally, random data will have what appears to be a valid HEC and will be output. Mindspeed is not aware of any use for this mode.
1	1	Raw Data mode; allows the CX28229 to be used as a generic 'serial to parallel' convertor. All data received will be passed across the UTOPIA bus in blocks of 53 bytes. No attempt is made to find ATM cells.
GENERAL NOTE: 1. The HEC Error Correction circuit is independent of the DisHECChk control bit. The CX28229 will correct single bit errors even when the DisHECChk is enabled (assuming that the EnHECCor bit is set to 1).		

5.2.3   Cell Screening

The CX2822x provides two optional types of cell screening. The first type, idle cell rejection, prevents idle cells from being passed on. The second type, user traffic screening, compares incoming bits to the values in the receive cell header registers. Cells are rejected or accepted based on the bit patterns of their headers.

Idle cell rejection is enabled in bit 6 of the CVAL register (0x0C). If this bit is set to 1, all incoming cells that match the contents of the Receive Idle Cell Header Control Registers, RXIDL1–4 (0x20–23), are rejected. Individual bits in the Receive Idle Cell Mask Control Registers, IDLMSK1–4 (0x24–27), can be set to 1 or Don't Care, causing the corresponding bits of the incoming cell to be treated as matching, regardless of their value. If idle cell rejection is disabled, cells pass directly to user traffic screening.

User traffic cell screening is similar to idle cell screening in that the incoming cells are compared to the Receive Cell Header Control Registers, RXHDR1–4 (0x18–1B). Individual bits in the Receive Cell Mask Control Registers, RXMSK1–4 (0x1C–1F), can be set to 1 or Don't Care, causing the corresponding bits of the incoming cell to be treated as matching, regardless of their values. The RejHdr bit (bit 7) in the CVAL register (0x0C) determines whether matching cells are rejected or accepted. If it is set to 0, matching cells are accepted. If it is set to 1, matching cells are rejected. See Table 5-2 and Table 5-3.

Table 5-2. Cell Screening—Matching

Receive Cell Mask Bit	Receive Cell Header Bit	Incoming Bit	Result
0	0	0	Match
0	0	1	Fail
0	1	0	Fail
0	1	1	Match
1	x	x	Match

Table 5-3. Cell Screening—Accept/Reject Cell

Cell	Reject Header	Result
Match	0	Accept Cell
Match	1	Reject Cell
Fail	0	Reject Cell
Fail	1	Accept Cell

5.2.4 Cell Scrambler

The ATM standard requires cell scrambling to ensure that only valid headers are found in the cell delineation process. Scrambling randomizes any repeated patterns or other data strings that could be mistaken for valid headers. The CX2822x supports two types of scrambling as defined by ITU-T I.432:

1. Self Synchronizing Scrambler (SSS)
2. Distributed Sample Scrambler (DSS). Typically, SSS is used and is, therefore, the CX2822x's default method. However, xDSL in asynchronous format generally use DSS.

NOTE: If both SSS and DSS are enabled, SSS overrides DSS.

5.2.4.1   SSS Scrambling

SSS scrambling uses the polynomial $\times^{43} + 1$ to scramble the payload, leaving the five header bytes untouched. It can be enabled in EnTxCellScr, bit 5, of the CGEN register (0x08).

Descrambling uses the same polynomial to recover the 48-byte cell payload. It can be enabled in EnRxCellScr, bit 4, of the CVAL register (0x0C). SSS scrambling runs at up to 45 Mbps.

5.2.4.2   DSS Scrambling

DSS scrambling uses the $\times^{31} + \times^{28} + 1$ polynomial to scramble the entire cell, except the HEC byte. HEC is calculated after the first four bytes of the header have been scrambled. DSS scrambling is enabled in EnTxDSSScr, bit 1, of the CGEN register (0x08).

Descrambling uses the first six bits of the HEC for alignment. Once alignment is found, all eight bits of the HEC are sampled. Descrambling uses the same polynomial to recover the 48-byte cell payload. It is enabled in EnRxDSSScr, bit 0, of the CGEN register (0x08). If DSS descrambling fails, the CX2822x defaults to unscrambled mode.

5.2.5   Framing Modes (UTOPIA-to-Serial Configuration)

The CX2822x's eight serial ports can be individually configured for the major framing modes to a maximum of 10 Mbps: T1/E1 and DSL. A general purpose framing mode provides an interface to customized framers at a maximum of 10 Mbps. Each of the eight ports can be configured for a different mode.

5.2.5.1   T1/E1 Interface

This describes the timing requirements of the CX28229 when operating in T1 or E1 mode. Connection to a CN8370 T1/E1 framer is used as an example, as illustrated in Figure 5-4. The CX28229 receives a T1/E1 data stream from the external framer, ignores the T1/E1 overhead, extracts the ATM cells, and passes the ATM cells to the ATM layer device. In the transmit direction, the CX28229 inserts 0's in the overhead bit locations and fills the rest of the frame with ATM cells from the UTOPIA bus.

For the E1 mode, the ATM cells are mapped into time slots 1–15 and 17–31 as described in *Recommendation G.804*. For the T1 mode, the ATM cells are mapped into time slots 1–24.

Figure 5-4. CN8370 Interface Diagram

General Notes:

In E1 mode, ATM cells are mapped into time slots 1–15 and 17–31 as described in Recommendation G.804.
In T1 mode, ATM cells are mapped into time slots 1–24.
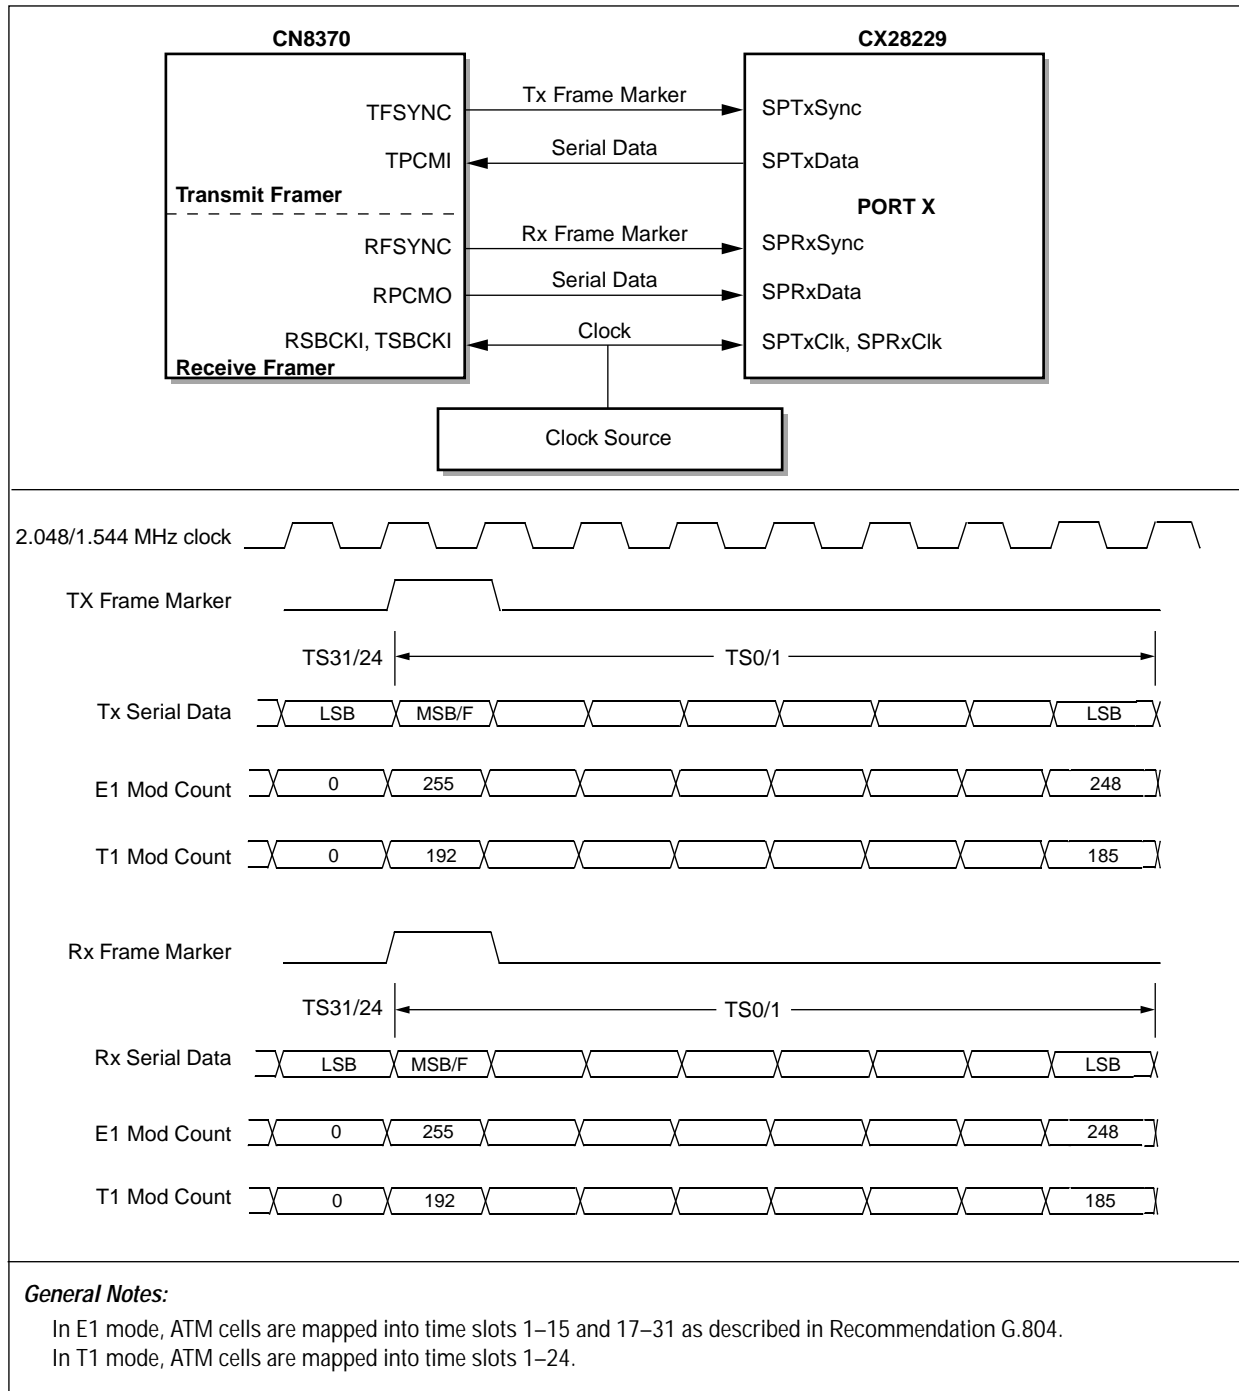

500027_065

Figure 5-5. Transmit Waveforms

General Notes:

The diagram shows the CX28229 programmed to sample on the rising edge of the clock.

For T_1, SPTxSync must occur at least 10 ns *after* the rising edge of the 193rd clock.

T_2 must have a minimum of 1 clock period.

For T_3, the hold time is 10 ns after the rising edge of the clock.
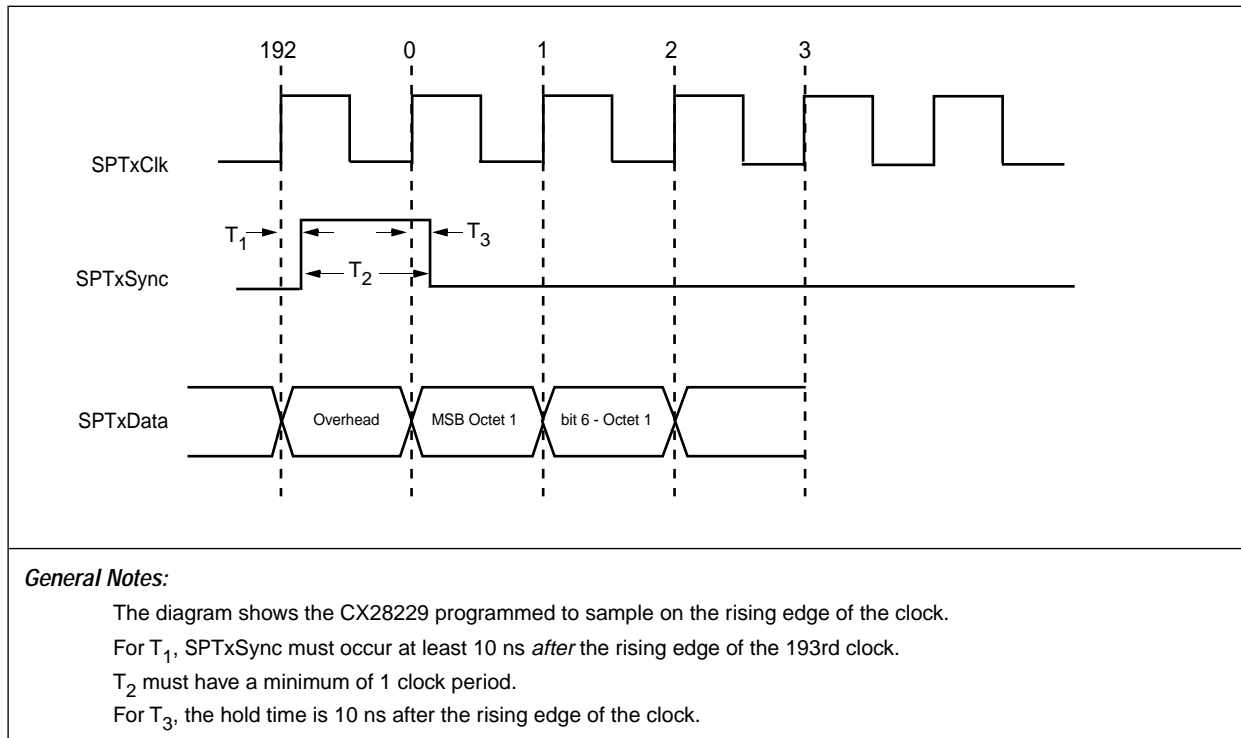

500027_064

Figure 5-6. Receive Waveforms

General Notes:

The diagram shows the CX28229 programmed to sample on the rising edge of the clock.

The Overhead bit is sampled on the clock edge 0.

For T_1, SPRxSync must occur at least 10 ns *after* the rising edge of the 193rd clock.

T_2 must have a minimum of 1 clock period.

For T_3, the hold time is 10 ns after the rising edge of the clock.
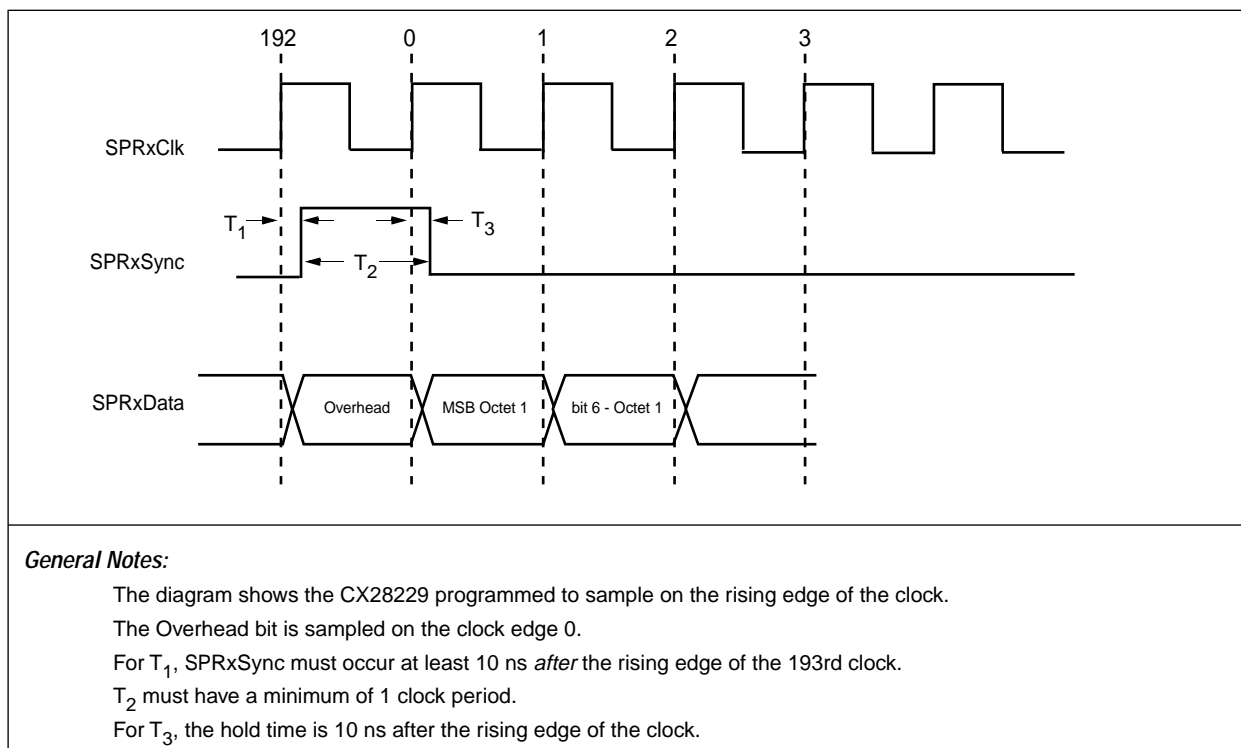

500027_066

5.2.5.2   DSL Mode Interface

The CX2822x has a DSL mode interface as illustrated in Figure 5-7. This mode allows connection with framers that require frame synchronization. The CX2822x receives a data stream from the external framer, performs byte-alignment and cell delineation, and passes the ATM cells to the ATM layer device. The CX2822x performs the inverse process on transmitted data. In this mode, the framer must ensure that only ATM cells are present in the data stream.

Figure 5-7.   DSL Mode

DSL Modem   **CX28229**

Transparent Cell Transport

General Notes:
[1] The CX28229 operates at data rates up to 10 Mbps.
[2] RxData is ignored when SPRxSync is asserted based on it's programmable active level. This may be used to mask overhead bits in the receive data stream. Polarity is shown as active low in above figure.
3. TxSync indicates the Start of Cell.
4. Tx and Rx are asynchronous.

500027_014

5.2.5.3   General Purpose Mode Interface

The CX2822x has a general purpose mode interface as illustrated in Figure 5-8. This mode allows connection with framers that do not provide frame synchronization. The CX2822x receives a data stream from the external framer, performs byte-alignment and cell delineation, and passes the ATM cells to the ATM layer device. The CX2822x performs the inverse process on transmitted data. In this mode, the framer must ensure that only ATM cells are present in the data stream.

Figure 5-8.   General Purpose Mode

General Notes:

[1]   The 1168 kbps limit is imposed by the Bt8970; the CX28229 operates at data rates up to 10 Mbps.

2.   In general purpose mode, the SPTxSync and SPRxSync pins are ignored but should be tied high to prevent noise being introduced to the device.

3.   Diagram shows default values for TxClkPol and RxClkPol (IOMODE register).

6

General Issues
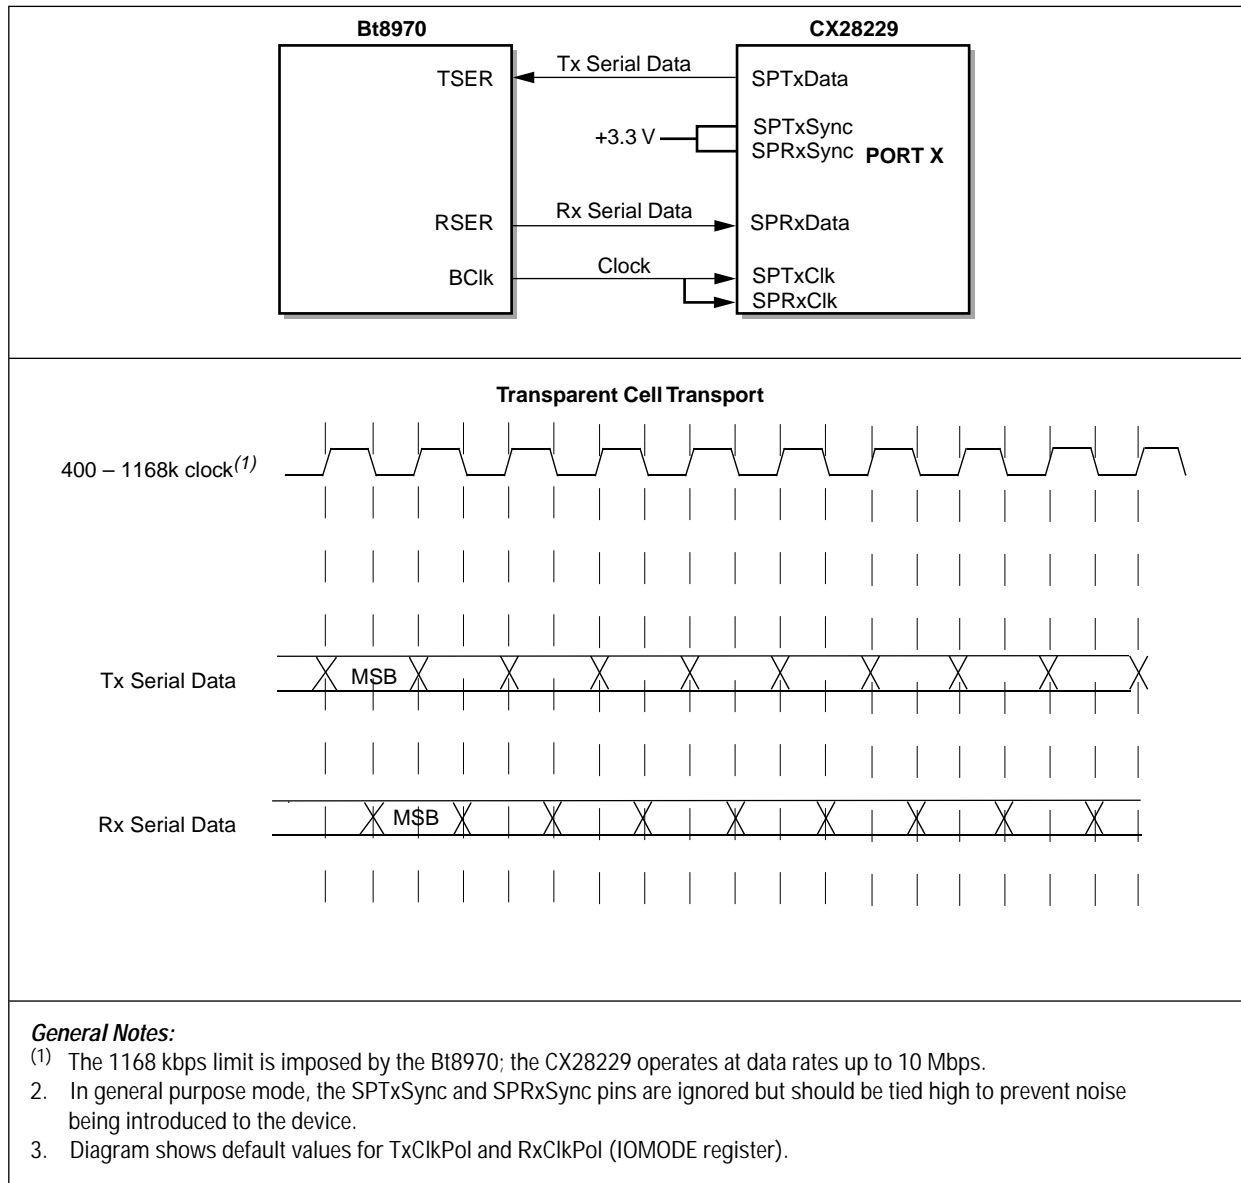

6.1 Micro Interface

The microprocessor interface transfers control and status information in 8-bit data transfers between the external microprocessor and CX2822x by means of write and/or read access to internal registers. This interface allows the microprocessor to configure the CX2822x by writing various control registers. These control registers can also be read for configuration confirmation. This interface also provides the ability to read the device's current condition via its status registers and counters. Summary status is available for rapid interrupt identification.

The microprocessor interface can operate in either an asynchronous mode or a synchronous mode. The MSyncMode pin (N5) determines which mode is active.

In the synchronous mode, the timing of these signals is synchronized to MicroClk, which is intended to be directly driven by the external microprocessor. This interface is compatible with the RS8236 and CN8237 SAR devices, providing no-wait-state operation.

NOTE: The MicroClk is required for both modes. In asynchronous mode, a MicroClk frequency of up to 50MHz, must be present but can be asynchronous to the other microprocessor signals. In synchronous mode, MicroClk is limited to 25MHz.

6.1.1 Resets

There are four software controlled reset functions, two at the device level and two at the port level. The two levels allow a user to reset either the entire CX2822x with one command or only a port within the device. The two logic resets allow the user to keep the device or port in a reset state while the control registers are being programmed. When the reset bit is deasserted, all changes to the registers take place simultaneously.

At the device level, the software-controlled DevMstRst, bit 7, in the MODE register (0x0200), restarts all device functions and sets the control and status registers, including IMA, to their default values except this bit (DevMstRst). The DevLgcRst, bit 6, in the MODE register (0x0200) restarts all device functions in the TC block but leaves all control registers unaffected.

At the port level, the PrtMstRst, bit 7, in the PMODE register (0x04), restarts all port functions and sets the registers for the associated port to their default values except this bit (PrtMstRst). The PrtLgcRst, bit 6, in the PMODE register (0x04) restarts all functions but leaves the port control registers unaffected.

6.1.2   Counters (TC Block Only)

The CX2822x counters record events within the TC block. Two types of events are recorded: error events, such as Section BIP errors, and transmission events, such as transmitted ATM cells.

Counters comprised of more than one register must be accessed by reading the least significant byte (LSB) first. This guarantees that the value contained in each component register accurately reflects the composite counter value at the time the LSB was read, because the counter may be updated while the component registers are being read.

Each counter is large enough to accommodate the maximum number of events that may occur within a one-second interval. The counters are cleared after being read. Therefore, if the counters are read every second, the application will receive an accurate recording of all events.

6.1.2.1   One-second Latching

The CX2822x's implementation of one-second latching ensures the integrity of the statistics being gathered by the network management software. Internal statistics counters can be latched at one-second intervals, which are synchronized to the OneSecIO pin (pin R5). Therefore, the data read from the statistic counters represents the same one second of real-time data, independent of network management software timing.

The CX2822x implements one-second latching for both status signals and counter values. When the EnStatLat bit (bit 5) in the MODE register (0x0202) is written to a logical 1, a read from any of the status registers returns the state of the device at the time of the previous OneSecIO pin (pin R5) assertion. When the EnCntrLat bit (bit 4) in the MODE register (0x0202) is written to a logical 1, a read from any of the counters returns the state of the device at the time of the previous OneSecIO pin (pin R5) assertion. Every second, the counter is read, moved to the latch, and the counter is cleared. The latch is cleared when read.

Software can configure the OneSecIO pin as an output that equals the input from the 8kHzIn divided by 8000. When configured as an input, status registers and counters may be latched on the rising edge of this input. See Bit 0 of the Mode register (0x200).

NOTE: When latching is disabled and a counter is wider than one byte, the LSB should be read first to retain the values of the other bytes for a subsequent read.

6.1.2.2   Interrupts

The CX2822x's interrupt indications can be classified as either single- or dual-event; a single-event interrupt is triggered by a status assertion; a dual-event interrupt is triggered by either a status assertion or deassertion. Both types of interrupts are further described in the following examples.

Single-event interrupt: When a parity error occurs on the UTOPIA transmit data bus, an interrupt is generated on ParErrInt, bit 7, in the TXCELLINT register (0x2C). This bit is cleared when read.

Dual-event interrupt: When LOCD occurs, bit 7 of the corresponding RXCELLINT register (0x0D) is set to 1. This bit is cleared when the register is read. Once cell delineation is recovered, bit 7 is set to 1 again, generating another interrupt.

All interrupt bits have a corresponding enable bit. This allows software to disable or mask interrupts as required.

NOTE: The IMA block does not generate interrupts.

The CX2822x uses three levels of interrupt indications. The first level consists of receive or transmit interrupt indications, which correspond to specific events on a specific port. The second level summarizes first level interrupts and indicates framer and one-second interrupts for each port. The third level indicates which port generated an interrupt.

The first level interrupt indications are located in registers TXCELLINT and RXCELLINT for each port. Each interrupt bit in these registers can be disabled in the corresponding ENCELLR or ENCELLT register, respectively. The result is then ORed into the appropriate bit in the port's SUMINT register.

The second level consists of summary interrupt indications, located in the SUMINT register. It also includes the OneSecInt and the ExInt indications. Each interrupt bit in these registers can be disabled in the corresponding ENSUMINT register. The result is then ORed into the appropriate bit in the SUMPORT register.

The third level contains the overall interrupt indications for each port in the SUMPORT register. These bits can be disabled in the ENSUMPORT register. The result is ORed to the MicroInt* pin. The MicroInt* pin can be enabled or disabled by setting the EnIntPin (bit 3) in the MODE register (0x202).

Figure 6-1 illustrates the flow chart of the interrupt generation process and Figure 6-2 illustrates the registers involved in the interrupt generation process.

Figure 6-1.   Interrupt Indication Flow Chart
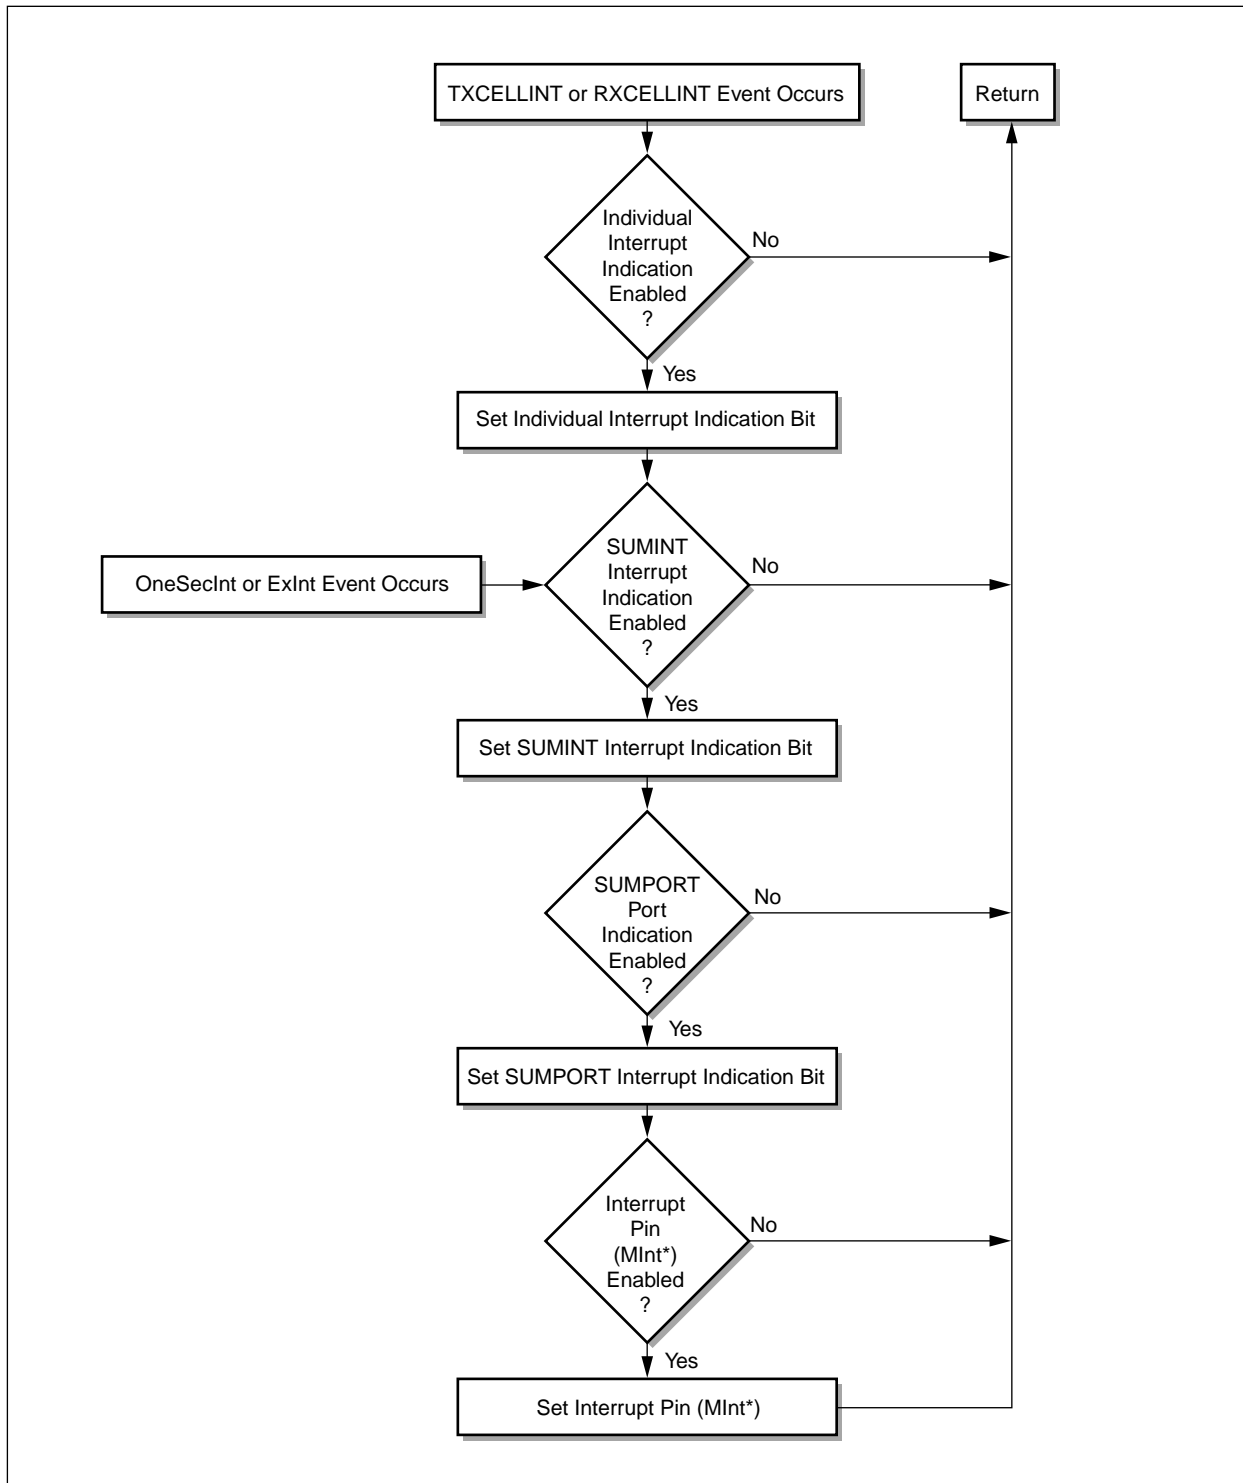

500027_015

Figure 6-2. Interrupt Indication Diagram (TC Block)
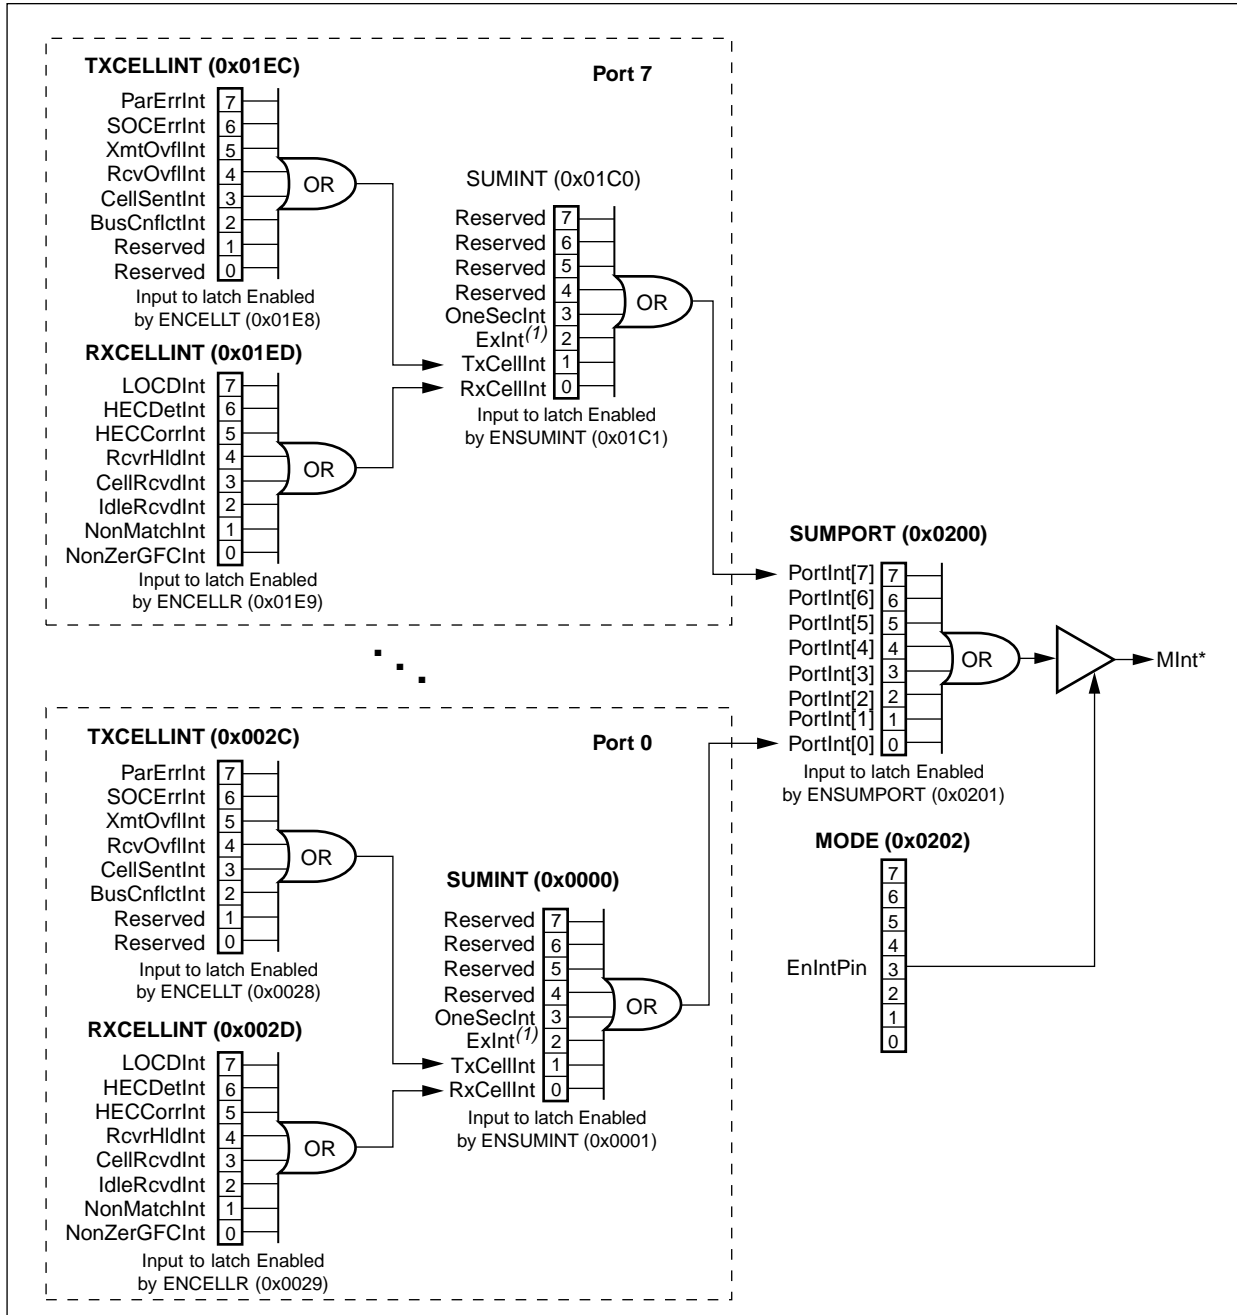

General Notes:
[1] This interrupt is generated by the associated external framer.

500027_016

6.1.2.3   Interrupt Servicing

When an interrupt occurs on the MicroInt* pin (pin B19), it could have been
generated by any of 128 events. The CX2822x's interrupt indication structure ensures
that no more than a maximum of three register reads are needed to determine the
source of an interrupt. The interrupt is traced back to its source using the following
steps:

1. Read the SUMPORT register to see which port(s) shows an interrupt.
2. Read the appropriate SUMINT register to see which bit(s) shows an interrupt.
   - Bit 0, RxCellInt, reflects activity in the RXCELLINT register.
   - Bit 1, TxCellInt, reflects activity in the TXCELLINT register.
   - Bit 2, ExInt, indicates an interrupt from an external framer.
   - Bit 3, OneSecInt, indicates a one-second interrupt.
   - Bits 4–7 are reserved.
3. If necessary, read the appropriate TXCELLINT or RXCELLINT register.

All Level 1 bits are cleared when the register is read. Once the register is read, ALL
bits in that register are reset to their default values. Therefore, interrupt service
routines must be designed to handle multiple interrupts in the same registers. In Level
2, OneSecInt and ExInt are cleared when the register is read. However, the TxCellInt
and RxCellInt bits are cleared only when the corresponding Level 1 register is read
and cleared. Level 3 bits are cleared when the entire corresponding Level 2 register
has been read and cleared.

7

Registers

The CX2822x registers control and observe the device's operations. Table 7-1 lists the address ranges that represent a device control and status range. The registers in each port range are replicated for the other ports. Table 7-2 lists the device-level control and status registers. Table 7-3 lists the port-level control and status registers. All registers are 8 bits wide. All control registers can be read to verify contents.

NOTE: Control bits that do not have a documented function are reserved and must be written to a logical 0.

Table 7-1. Address Ranges

Port Offset Address Range (Hex)	Description	Port Base Address (Hex)
0000–003F	Port 0 Control and Status Registers	0000
0040–007F	Port 1 Control and Status Registers	0040
0080–00BF	Port 2 Control and Status Registers	0080
00C0–00FF	Port 3 Control and Status Registers	00C0
0100–013F	Port 4 Control and Status Registers	0100
0140–017F	Port 5 Control and Status Registers	0140
0180–01BF	Port 6 Control and Status Registers	0180
01C0–01FF	Port 7 Control and Status Registers	01C0
0200–0208	Device Control and Status Registers	—
0209–300	Reserved, set to a logical 0.	—
300–30D	Reserved, set to a logical 0.	—
320–32D	Reserved, set to a logical 0.	—
340–34D	Reserved, set to a logical 0.	—
360–36D	Reserved, set to a logical 0.	—
380–38D	Reserved, set to a logical 0.	—
3A0–3AD	Reserved, set to a logical 0.	—
3C0–3CD	Reserved, set to a logical 0.	—
3E0–3ED	Reserved, set to a logical 0.	—
0400–07FF	IMA Control and Status Registers	—

The device level registers in Table 7-2 provide control for the device's major operating modes, as well as status and control for summary interrupts.

Table 7-2. Device Control and Status Registers

Address	Name	Type	OneSec Latching	Description	Page Number
0x0200	MODE	R/W	—	Device Mode Control Register	page 7-64
0x0201	PHYINTFC	R/W	—	PHY-side Interface Control Register	page 7-65
0x0202	ATMINTFC	R/W	—	ATM-side Interface Control Register	page 7-65
0x0203	OUTSTAT	R/W	—	Output Status Control Register	page 7-65
0x0204	SUMPORT	R	—	Summary Port Interrupt Status Register	page 7-66
0x0205	ENSUMPORT	R/W	—	Summary Port Interrupt Control Register	page 7-66
0x0208	PART/VER	R	—	Part Number/Version Register	page 7-67

The registers listed in Table 7-3 are replicated for each port. Two methods can be used to determine the exact address of a specific register in a specific port. All numbers are in hexadecimal.

1. Add the port offset address to the port base address as shown in Table 7-1. For example:
   For Port 3, IOMODE register
   00C0 (Port 3 base address) + 0x05 (port offset address) = 00C5
2. Use the following formula:
   0x40 (port register map size) $\times$ *n* (port number) + port offset address = exact register address

Table 7-3. Port Control and Status Registers (1 of 3)

Port Offset Address	Name	Type	One-second Latching	Description	Page Number
0x00	SUMINT	R	—	Summary Interrupt Status Register	page 7-33
0x01	ENSUMINT	R/W	—	Summary Interrupt Control Register	page 7-34
0x02	—	—	—	Reserved, set to a logical 0	—
0x03	—	—	—	Reserved, set to a logical 0	—

0x00—SUMINT (Summary Interrupt Indication Status Register)

The SUMINT register indicates the one-second interrupts, external framer interrupts, and port summary interrupts.

Bit	Default	Name	Description
7	0	—	Reserved, set to a logical 0.
6	0	—	Reserved, set to a logical 0.
5	0	—	Reserved, set to a logical 0.
4	—	—	Reserved, set to a logical 0.
3	—	OneSecInt[1]	When a logical 1 is read, this bit indicates a One Second Interrupt. This interrupt signifies that a rising edge occurred on the OneSecIO pin (pin R5). This interrupt is generated for each rising edge on the OneSecIO pin.
2	0	—	Reserved, set to a logical 0.
1	—	TxCellInt[3]	When a logical 1 is read, this bit indicates a Transmit Cell Interrupt. This interrupt is a summary interrupt and signifies that an interrupt indication occurred in the TxCellInt register (0x2C).
0	—	RxCellInt[3]	When a logical 1 is read, this bit indicates a Receive Cell Interrupt. This interrupt is a summary interrupt and signifies that an interrupt indication occurred in the RxCellInt register (0x2D).

FOOTNOTE:
[1] This bit is cleared when this register is read in any of the eight ports.
[2] Single event—A 1 to 0 transition on the corresponding pin causes this interrupt to occur, provided that this interrupt has been enabled by the corresponding enable bit. Reading this interrupt register clears this interrupt.
[3] This bit is a summary indication of any interrupt events that occurred in the indicated registers. This bit is a pointer to the next interrupt indication register to be read. This bit will be cleared when the interrupt bits in the corresponding interrupt indication registers are read and automatically cleared.

0x01—ENSUMINT (Summary Interrupt Control Register)

The ENSUMINT register controls which of the interrupts listed in the SUMINT register (0x00) appear in the SUMPORT register and on the MicroInt* (pin T1), provided the corresponding ENSUMPORT bit is enabled and EnIntPin (bit 3) in the MODE register (0x0202) is enabled.

Bit	Default	Name	Description
7	0	—	Reserved, set to a logical 0.
6	0	—	Reserved, set to a logical 0.
5	0	—	Reserved, set to a logical 0.
4	0	—	Reserved, set to a logical 0.
3	0	EnOneSecInt	When written to a logical 1, this bit enables the one-second interrupt generated by the OneSecIO pin (pin R5) to appear on the MicroInt* output pin (pin T1).
2	0	—	Reserved, set to a logical 0.
1	0	EnTxCellInt	When written to a logical 1, this bit enables the transmit cell interrupts located in the TxCellInt register (0x2C). These interrupts appear can on the MicroInt* pin (pin T1), provided that EnPortInt in the ENSUMPORT register (0x0201) is enabled for this port and EnIntPin (bit 3) in the MODE register (0x0202) is enabled.
0	0	EnRxCellInt	When written to a logical 1, this bit enables the receive cell interrupts located in the RxCellInt register (0x2D). These interrupts can appear on the MicroInt* pin (pin T1), provided that EnPortInt in the ENSUMPORT register (0x0201) is enabled for this port and EnIntPin (bit 3) in the MODE register (0x0202) is enabled.

0x04—PMODE (Port Mode Control Register)

The PMODE register controls the port-level software resets, source loopback, and physical layer interface mode.

Bit	Default	Name	Description
7	0	PrtMstRst	When written to a logical 1, this bit initiates a Port Master Reset. All internal state machines associated with this port are reset and all control registers for this port, except this one, assume their default values. Only bits 0–6 in this register are overwritten with their default values.
6	0	PrtLgcRst	When written to a logical 1, this bit initiates a Port Logic Reset. All internal state machines associated with this port are reset but all registers (0x00–0x3F) listed as "Type: W/R" in Table 7-3 are unaltered. Output signals for this port are three-state during Port Logic Reset.
5	0	SrcLoop[1]	When written to a logical 1, this bit enables a source loopback. The line transmit clock and data outputs are connected to the line receive clock and data inputs. Refer to Figure 2-8. During Source loopback, the device is automatically configured for General Purpose mode (ignoring the contents of the PhyType[2:0] bits).
4	0	FeLnLoop[1]	Enables Far-end line loopback. In this mode, the receive data is processed by the TC block and looped back at the UTOPIA interface to the transmit side. Refer to Figure 2-9.
3	0	—	Reserved, set to a logical 0.
2	0	PhyType[2][1]	These bits determine the Physical Layer Interface Mode: 000—T1 mode 011—Reserved 110—DSL Mode 001—E1 mode 100—Reserved 111—Power Down 010—Reserved 101—General Purpose In General Purpose Mode, the SPRxSync and SPTxSync pins are ignored. (However, good design practice would have them tied high.)
1	0	PhyType[1][1]	
0	0	PhyType[0][1]	

FOOTNOTE:
[1] These bits should only be changed when the device or port logic reset is asserted.

0x05—IOMODE (Input/Output Mode Control Register)

The IOMODE register controls the line interface signal polarities and status outputs.

Bit	Default	Name	Description
7	0	—	Reserved, set to 0.
6	0	RxSyncPol[1]	This bit determines the Receiver Synchronization input Polarity. When written to a logical 1, the active level on the SPRxSync input is high. When written to a logical 0, the active level is low.
5	0	RxClkPol[1]	This bit determines the Receiver Clock Input Polarity. When written to a logical 1, the active edge on the SPRxClk input is the falling edge. When written to a logical 0, the active edge is the rising edge.
4	0	TxSyncPol[1]	This bit determines the Transmitter Synchronization input Polarity. When written to a logical 1, the active level on the SPTxSync input is high. When written to a logical 0, the active level is low.
3	0	TxClkPol[1]	This bit determines the Transmitter Clock Input Polarity. When written to a logical 1, the active edge on the SPTxClk input is the falling edge. When written to a logical 0, the active edge is the rising edge.
2	0	—	Reserved, set to 0.
1	0	—	Reserved, set to 0.
0	0	—	Reserved, set to 0.

FOOTNOTE:
[1] These bits should only be changed when the device or port logic reset is asserted.

0x08—CGEN (Cell Generation Control Register)

The CGEN register controls the device's cell generation functions.

Bit	Default	Name	Description
7	0	DisHEC	When written to a logical 1, this bit disables internal generation of the HEC field. When disabled, the HEC field from the UTOPIA interface remains unchanged in the transmitted cell. When written to a logical 0, HEC is internally calculated and inserted in the transmitted cell.
6	1	EnTxCos	When written to a logical 1, this bit enables the Transmit HEC Coset. When written to a logical 0, the HEC Coset is disabled.
5	1	EnTxCellScr	When written to a logical 1, this bit enables the Transmit Cell Scrambler. When written to a logical 0, the Transmit Cell Scrambler is disabled.
4	0	ErrHEC	When written to a logical 1, this bit causes the ERRPAT register to be XORed with the calculated HEC byte for one transmit cell. These bits are cleared automatically by internal circuitry after the indicated error insertion has taken place. Clearing takes precedence over a simultaneous write operation to this register.
3	0	DSLSyncPol	This bit controls the polarity of the sync pulse in DSL mode. Set to 1 for active high and to 0 for active low.
2	0	—	Reserved, write to a logical 0.
1	0	EnTxDSSScr	When written to a logical 1, this bit enables the Transmit DSS Scrambler. When written to a logical 0, the Transmit DSS Scrambler is disabled.
0	0	EnRxDSSScr	When written to a logical 1, this bit enables the Receive DSS Scrambler. When written to a logical 0, the Receive DSS Scrambler is disabled.

0x09—HDRFIELD (Header Field Control Register)

The HDRFIELD register controls the header insertion elements.

Bit	Default	Name	Description
7	0	—	Reserved, write to a logical 0.
6	0	—	Reserved, write to a logical 0.
5	0	—	Reserved, write to a logical 0.
4	0	InsGFC	When written to a logical 1, this bit inserts a Generic Flow Control (GFC) field in the outgoing header from the TXHDR registers. When written to a logical 0, the GFC field is not changed prior to transmission.
3	0	InsVPI	When written to a logical 1, this bit inserts a Virtual Path Identifier (VPI) field in the outgoing header from the TXHDR registers. When written to a logical 0, the VPI field is not changed prior to transmission.
2	0	InsVCI	When written to a logical 1, this bit inserts a Virtual Channel Identifier (VCI) field in the outgoing header from the TXHDR registers. When written to a logical 0, the VCI field is not changed prior to transmission.
1	0	InsPT	When written to a logical 1, this bit inserts a Payload Type (PT) field in the outgoing header from the TXHDR registers. When written to a logical 0, the PT field is not changed prior to transmission.
0	0	InsCLP	When written to a logical 1, this bit inserts a Cell Loss Priority (CLP) bit in the outgoing header from the TXHDR registers. When written to a logical 0, the CLP field is not changed prior to transmission.

0x0A—IDLPAY (Transmit Idle Cell Payload Control Register)

The IDLPAY register contains the transmit idle cell payload.

Bit	Default	Name	Description
7	0	IdlPay[7]	These bits hold the Transmit Idle Cell Payload values for outgoing idle cells.
6	1	IdlPay[6]	
5	1	IdlPay[5]	
4	0	IdlPay[4]	
3	1	IdlPay[3]	
2	0	IdlPay[2]	
1	1	IdlPay[1]	
0	0	IdlPay[0]	

0x0B—ERRPAT (Error Pattern Control Register)

The ERRPAT register provides the error pattern for the HEC error insertion function. ErrHEC (bit 4) in the CGEN register (0x08) enables this function. Each bit in the error pattern register is XORed with the corresponding bit of the calculated HEC byte to be errored.

Bit	Default	Name	Description
7	0	ErrPat[7]	Error pattern bit 7.
6	0	ErrPat[6]	Error pattern bit 6.
5	0	ErrPat[5]	Error pattern bit 5.
4	0	ErrPat[4]	Error pattern bit 4.
3	0	ErrPat[3]	Error pattern bit 3.
2	0	ErrPat[2]	Error pattern bit 2.
1	0	ErrPat[1]	Error pattern bit 1.
0	0	ErrPat[0]	Error pattern bit 0.

0x0C—CVAL (Cell Validation Control Register)

The CVAL register controls the validation of incoming cells.

Bit	Default	Name	Description
7	0	RejHdr	When written to a logical 1, this bit enables the Rejection of certain Header cells. When enabled, cells with headers matching the RXHDRx/RXMSKx definition are rejected and all others are accepted. When written to a logical 0, cells with matching headers are accepted and cells with non-matching headers are rejected.
6	1	DelIdle	When written to a logical 1, this bit enables the Deletion of Idle Cells. When enabled, cells matching the RXIDL/IDLMSK definition are deleted from the received cell stream. When written to a logical 0, idle cells are included in the received stream.
5	1	EnRxCos	When written to a logical 1, this bit enables the Receive HEC Coset. When written to a logical 0, the HEC Coset is disabled.
4	1	EnRxCellScr	When written to a logical 1, this bit enables the Receive Cell Scrambler. When written to a logical 0, the Receive Cell Scrambler is disabled.
3	0	EnHECCorr	When written to a logical 1, this bit enables HEC Correction. When written to a logical 0, HEC Correction is disabled.
2	0	DisHECChk	When written to a logical 1, this bit disables HEC Checking. When written to a logical 0, HEC checking is performed as a cell validation criterion. See Table 5-1.
1	0	DisCellRcvr	When written to a logical 1, this bit disables the Cell Receiver. When disabled, all cell reception is disabled on the next cell boundary. When written to a logical 0, cell reception begins or resumes on the next cell boundary.
0	0	DisLOCD	When written to a logical 1, this bit disables Loss of Cell Delineation. When disabled, cells are passed even if cell delineation has not been found. When written to a logical 0, cells are passed only while cell alignment has been achieved. See Table 5-1.

0x0D—UTOP1 (UTOPIA Control Register 1)

The UTOP1 register controls the UTOPIA resets, parity orientation, and the transmit FIFO fill-level threshold.

Bit	Default	Name	Description
7	0	TxReset	When written to a logical 1, this bit resets the transmit FIFO pointers. This reset should only be used as a test function because it can create short cells.
6	0	RxReset	When written to a logical 1, this bit resets the receive FIFO pointers. This reset should only be used as a test function because it can create short cells.
5	0	—	Reserved, write to a logical 0.
4	0	—	Reserved, write to a logical 0.
3	0	—	Reserved, write to a logical 0.
2	0	—	Reserved, write to a logical 0.
1	0	—	Reserved, write to a logical 0.
0	0	—	Reserved, write to a logical 0.

FOOTNOTE:
[1] These bits should only be changed when the device or port logic reset is asserted.

0x0E—UTOP2 (UTOPIA Control Register 2) (TC Block)

The UTOP2 register contains the multi-PHY address value for the port.

Bit	Default	Name	Description
7	0	—	Reserved, write to a logical 0.
6	0	—	Reserved, write to a logical 0.
5	x	UtopDis[1]	When written to a logical 1, this bit disables UTOPIA outputs for this port. <table><tr><th>Version</th><th>Default</th></tr><tr><td>CX28229-11</td><td>0</td></tr><tr><td>CX28229-12 and later</td><td>1</td></tr></table>
4	0	MphyAddr[4]—MSB[1]	These bits are the Multi-PHY Device Address. Each CX2822x port should have a unique address. These bits correspond to the URxAddr and UTxAddr pins. When the pin matches the bit values, the port is accessed. This port ignores any transactions meant for another port or PHY device.
3	0	MphyAddr[3][1]	
2	(2)	MphyAddr[2][1]	
1	(2)	MphyAddr[1][1]	
0	(2)	MphyAddr[0]—LSB[1]	

FOOTNOTE:
[1] These bits should only be changed when the device or port logic reset is asserted.
[2] The default for these bits is the port number for each port. (000—Port 0, 001—Port 1, 010—Port 2, 011—Port 3, 100—Port 4, 101—Port 5, 110—Port 6, 111—Port 7)

0x0F—UDF2 (UDF2 Control Register)

The contents of the UDF2 register are inserted into the UDF2 byte on the UTOPIA receive bus when operating in 16-bit UTOPIA mode.

Bit	Default	Name	Description
7	0	UDF2[7]	The contents of this register are output over the UTOPIA receive bus when operating in UTOPIA 16-bit mode. The default matches the port address.
6	0	UDF2[6]	
5	0	UDF2[5]	
4	0	UDF2[4]	
3	0	UDF2[3]	
2	(1)	UDF2[2]	
1	(1)	UDF2[1]	
0	(1)	UDF2[0]	

FOOTNOTE:
(1) The default for these bits is the port number for each port. (000—Port 0, 001—Port 1, 010—Port 2, 011—Port 3, 100—Port 4, 101—Port 5, 110—Port 6, 111—Port 7)

0x10—TXHDR1 (Transmit Cell Header Control Register 1)

The TXHDR1 register contains the first byte of the Transmit Cell Header. It controls the header value that is inserted in the transmitted cell. This header consists of 32 bits divided among four registers (TXHDR1–4).

Bit	Default	Name	Description
7	0	TxHdr1[7]	These bits hold the Transmit Header values for Octet 1 of the outgoing cell. Insertion of the bits is controlled by the HDRFIELD register (0x09).
6	0	TxHdr1[6]	
5	0	TxHdr1[5]	GFC/VPI bits (for UNI they are GFC bits, for NNI they are VPI bits)
4	0	TxHdr1[4]	
3	0	TxHdr1[3]	VPI bits
2	0	TxHdr1[2]	
1	0	TxHdr1[1]	
0	0	TxHdr1[0]	

0x11—TXHDR2 (Transmit Cell Header Control Register 2)

The TXHDR2 register contains the second byte of the Transmit Cell Header. (See 0x10—TXHDR1.)

Bit	Default	Name	Description
7	0	TxHdr2[7]	These bits hold the Transmit Header values for Octet 2 of the outgoing cell. Insertion of the bits is controlled by the HDRFIELD register (0x09).
6	0	TxHdr2[6]	
5	0	TxHdr2[5]	VPI bits
4	0	TxHdr2[4]	
3	0	TxHdr2[3]	
2	0	TxHdr2[2]	VCI bits
1	0	TxHdr2[1]	
0	0	TxHdr2[0]	

0x12—TXHDR3 (Transmit Cell Header Control Register 3)

The TXHDR3 register contains the third byte of the Transmit Cell Header. (See 0x10—TXHDR1.)

Bit	Default	Name	Description
7	0	TxHdr3[7]	These bits hold the Transmit Header values for Octet 3 of the outgoing cell. Insertion of the bits is controlled by the HDRFIELD register (0x09).
6	0	TxHdr3[6]	
5	0	TxHdr3[5]	
4	0	TxHdr3[4]	
3	0	TxHdr3[3]	VCI bits
2	0	TxHdr3[2]	
1	0	TxHdr3[1]	
0	0	TxHdr3[0]	

0x13—TXHDR4 (Transmit Cell Header Control Register 4)

The TXHDR4 register contains the fourth byte of the Transmit Cell Header. (See 0x10—TXHDR1.)

Bit	Default	Name	Description
7	0	TxHdr4[7]	These bits hold the Transmit Header values for Octet 4 of the outgoing cell. Insertion of the bits is controlled by the HDRFIELD register (0x09).
6	0	TxHdr4[6]	
5	0	TxHdr4[5]	VCI bits
4	0	TxHdr4[4]	
3	0	TxHdr4[3]	
2	0	TxHdr4[2]	Payload-type bits
1	0	TxHdr4[1]	
0	0	TxHdr4[0]	Cell Loss Priority bit

0x14—TXIDL1 (Transmit Idle Cell Header Control Register 1)

The TXIDL1 register contains the first byte of the Transmit Idle Cell Header. It controls the header value that is inserted in the transmitted idle cells. This header consists of 32 bits divided among four registers.

Bit	Default	Name	Description
7	0	TxIdl1[7]	These bits hold the Transmit Idle Cell Header values for Octet 1 of the outgoing cell.
6	0	TxIdl1[6]	
5	0	TxIdl1[5]	GFC/VPI bits (for UNI they are GFC bits, for NNI the are VPI bits)
4	0	TxIdl1[4]	
3	0	TxIdl1[3]	
2	0	TxIdl1[2]	VPI bits
1	0	TxIdl1[1]	
0	0	TxIdl1[0]	

0x15—TXIDL2 (Transmit Idle Cell Header Control Register 2)

The TXIDL2 register contains the second byte of the Transmit Idle Cell Header. (See 0x14—TXIDL1.)

Bit	Default	Name	Description
7	0	TxIdl2[7]	These bits hold the Transmit Idle Cell Header values for Octet 2 of the outgoing cell.
6	0	TxIdl2[6]	
5	0	TxIdl2[5]	VPI bits
4	0	TxIdl2[4]	
3	0	TxIdl2[3]	
2	0	TxIdl2[2]	
1	0	TxIdl2[1]	VCI bits
0	0	TxIdl2[0]	

0x16—TXIDL3 (Transmit Idle Cell Header Control Register 3)

The TXIDL3 register contains the third byte of the Transmit Idle Cell Header. (See 0x14—TXIDL1.)

Bit	Default	Name	Description
7	0	TxIdl3[7]	These bits hold the Transmit Idle Cell Header values for Octet 3 of the outgoing cell.
6	0	TxIdl3[6]	
5	0	TxIdl3[5]	
4	0	TxIdl3[4]	
3	0	TxIdl3[3]	VCI bits
2	0	TxIdl3[2]	
1	0	TxIdl3[1]	
0	0	TxIdl3[0]	

0x17—TXIDL4 (Transmit Idle Cell Header Control Register 4)

The TXIDL4 register contains the fourth byte of the Transmit Idle Cell Header. (See 0x14—TXIDL1.)

Bit	Default	Name	Description
7	0	TxIdl4[7]	These bits hold the Transmit Idle Cell Header values for Octet 4 of the outgoing cell.
6	0	TxIdl4[6]	
5	0	TxIdl4[5]	VCI bits
4	0	TxIdl4[4]	
3	0	TxIdl4[3]	
2	0	TxIdl4[2]	Payload-type bits
1	0	TxIdl4[1]	
0	1	TxIdl4[0]	Cell Loss Priority bit

0x18—RXHDR1 (Receive Cell Header Control Register 1)

The RXHDR1 register contains the first byte of the Receive Cell Header. The header values direct ATM cells to the UTOPIA port if an incoming ATM cell header matches the value in the header register. Receive Header Mask Registers further qualify ATM cell reception. This header consists of 32 bits divided among four registers.

Bit	Default	Name	Description
7	0	RxHdr1[7]	These bits hold the Receive Header values for Octet 1 of the incoming cell.
6	0	RxHdr1[6]	
5	0	RxHdr1[5]	
4	0	RxHdr1[4]	
3	0	RxHdr1[3]	
2	0	RxHdr1[2]	
1	0	RxHdr1[1]	
0	0	RxHdr1[0]	

0x19—RXHDR2 (Receive Cell Header Control Register 2)

The RXHDR2 register contains the second byte of the Receive Cell Header. (See 0x18—RXHDR1.)

Bit	Default	Name	Description
7	0	RxHdr2[7]	These bits hold the Receive Header values for Octet 2 of the incoming cell.
6	0	RxHdr2[6]	
5	0	RxHdr2[5]	
4	0	RxHdr2[4]	
3	0	RxHdr2[3]	
2	0	RxHdr2[2]	
1	0	RxHdr2[1]	
0	0	RxHdr2[0]	

0x1A—RXHDR3 (Receive Cell Header Control Register 3)

The RXHDR3 register contains the third byte of the Receive Cell Header. (See 0x18—RXHDR1.)

Bit	Default	Name	Description
7	0	RxHdr3[7]	These bits hold the Receive Header values for Octet 3 of the incoming cell.
6	0	RxHdr3[6]	
5	0	RxHdr3[5]	
4	0	RxHdr3[4]	
3	0	RxHdr3[3]	
2	0	RxHdr3[2]	
1	0	RxHdr3[1]	
0	0	RxHdr3[0]	

0x1B—RXHDR4 (Receive Cell Header Control Register 4)

The RXHDR4 register contains the fourth byte of the Receive Cell Header. (See 0x18—RXHDR1.)

Bit	Default	Name	Description
7	0	RxHdr4[7]	These bits hold the Receive Header values for Octet 4 of the incoming cell.
6	0	RxHdr4[6]	
5	0	RxHdr4[5]	
4	0	RxHdr4[4]	
3	0	RxHdr4[3]	
2	0	RxHdr4[2]	
1	0	RxHdr4[1]	
0	0	RxHdr4[0]	

0x1C—RXMSK1 (Receive Cell Mask Control Register 1)

The RXMSK1 register contains the first byte of the Receive Cell Mask. It modifies ATM cell screening, which compares the Receive Cell Header Registers to the incoming cells. Setting a bit in the Mask Register causes the corresponding bit in the received ATM cell header to be disregarded for screening. For example, setting RXMSK1 bit 0 to 1 causes ATM cells to be accepted with either 1 or 0 in the octet 1, bit 0 position. Combinations of Receive Header Mask bits can select groups of ATM VPI/VCIs for reception. This mask consists of 32 bits divided among four registers.

Bit	Default	Name	Description
7	1	RxMsk1[7]	These bits hold the Receive Header Mask for Octet 1 of the incoming cell.
6	1	RxMsk1[6]	
5	1	RxMsk1[5]	
4	1	RxMsk1[4]	
3	1	RxMsk1[3]	
2	1	RxMsk1[2]	
1	1	RxMsk1[1]	
0	1	RxMsk1[0]	

0x1D—RXMSK2 (Receive Cell Mask Control Register 2)

The RXMSK2 register contains the second byte of the Receive Cell Mask. (See 0x1D—RXMSK1.)

Bit	Default	Name	Description
7	1	RxMsk2[7]	These bits hold the Receive Header Mask for Octet 2 of the incoming cell.
6	1	RxMsk2[6]	
5	1	RxMsk2[5]	
4	1	RxMsk2[4]	
3	1	RxMsk2[3]	
2	1	RxMsk2[2]	
1	1	RxMsk2[1]	
0	1	RxMsk2[0]	

0x1E—RXMSK3 (Receive Cell Mask Control Register 3)

The RXMSK3 register contains the third byte of the Receive Cell Mask. (See 0x1D—RXMSK1.)

Bit	Default	Name	Description
7	1	RxMsk3[7]	These bits hold the Receive Header Mask for Octet 3 of the incoming cell.
6	1	RxMsk3[6]	
5	1	RxMsk3[5]	
4	1	RxMsk3[4]	
3	1	RxMsk3[3]	
2	1	RxMsk3[2]	
1	1	RxMsk3[1]	
0	1	RxMsk3[0]	

0x1F—RXMSK4 (Receive Cell Mask Control Register 4)

The RXMSK4 register contains the fourth byte of the Receive Cell Mask. (See 0x1D—RXMSK1.)

Bit	Default	Name	Description
7	1	RxMsk4[7]	These bits hold the Receive Header Mask for Octet 4 of the incoming cell.
6	1	RxMsk4[6]	
5	1	RxMsk4[5]	
4	1	RxMsk4[4]	
3	1	RxMsk4[3]	
2	1	RxMsk4[2]	
1	1	RxMsk4[1]	
0	1	RxMsk4[0]	

0x20—RXIDL1 (Receive Idle Cell Header Control Register 1)

The RXIDL1 register contains the first byte of the Receive Idle Cell Header. It defines ATM idle cells for the cell receiver. Idle cells are discarded from the received stream if register CVAL (0x0C) bit 6 is set to 1. This header consists of 32 bits divided among four registers.

Bit	Default	Name	Description
7	0	RxIdl1[7]	These bits hold the Receive Idle cell header for Octet 1 of the incoming cell.
6	0	RxIdl1[6]	
5	0	RxIdl1[5]	
4	0	RxIdl1[4]	
3	0	RxIdl1[3]	
2	0	RxIdl1[2]	
1	0	RxIdl1[1]	
0	0	RxIdl1[0]	

0x21—RXIDL2 (Receive Idle Cell Header Control Register 2)

The RXIDL2 register contains the second byte of the Receive Idle Cell Header. (See 0x20—RXIDL1.)

Bit	Default	Name	Description
7	0	RxIdl2[7]	These bits hold the Receive Idle cell header for Octet 2 of the incoming cell.
6	0	RxIdl2[6]	
5	0	RxIdl2[5]	
4	0	RxIdl2[4]	
3	0	RxIdl2[3]	
2	0	RxIdl2[2]	
1	0	RxIdl2[1]	
0	0	RxIdl2[0]	

0x22—RXIDL3 (Receive Idle Cell Header Control Register 3)

The RXIDL3 register contains the third byte of the Receive Idle Cell Header. (See 0x20—RXIDL1.)

Bit	Default	Name	Description
7	0	RxIdl3[7]	These bits hold the Receive Idle cell header for Octet 3 of the incoming cell.
6	0	RxIdl3[6]	
5	0	RxIdl3[5]	
4	0	RxIdl3[4]	
3	0	RxIdl3[3]	
2	0	RxIdl3[2]	
1	0	RxIdl3[1]	
0	0	RxIdl3[0]	

0x23—RXIDL4 (Receive Idle Cell Header Control Register 4)

The RXIDL4 register contains the fourth byte of the Receive Idle Cell Header. (See 0x20—RXIDL1.)

Bit	Default	Name	Description
7	0	RxIdl4[7]	These bits hold the Receive Idle cell header for Octet 4 of the incoming cell.
6	0	RxIdl4[6]	
5	0	RxIdl4[5]	
4	0	RxIdl4[4]	
3	0	RxIdl4[3]	
2	0	RxIdl4[2]	
1	0	RxIdl4[1]	
0	1	RxIdl4[0]	

0x24—IDLMSK1 (Receive Idle Cell Mask Control Register 1)

The IDLMSK1 register contains the first byte of the Receive Idle Cell Mask. It modifies ATM cell screening, which compares the Receive Idle Cell Header Registers to the incoming cells. Setting a bit in the Mask Register causes the corresponding bit in the received ATM idle cell header to be disregarded for screening. For example, setting IDLMSK1 bit 0 to 1 causes cells to be accepted as ATM idle cells with either 1 or 0 in the octet 1, bit 0 position. This header consists of 32 bits divided among four registers.

Bit	Default	Name	Description
7	0	IdlMsk1[7]	These bits hold the Receive Idle cell header mask for Octet 1 of the incoming cell.
6	0	IdlMsk1[6]	
5	0	IdlMsk1[5]	
4	0	IdlMsk1[4]	
3	0	IdlMsk1[3]	
2	0	IdlMsk1[2]	
1	0	IdlMsk1[1]	
0	0	IdlMsk1[0]	

0x25—IDLMSK2 (Receive Idle Cell Mask Control Register 2)

The IDLMSK2 register contains the second byte of the Receive Idle Cell Mask. (See 0x24—RXMSKL1.)

Bit	Default	Name	Description
7	0	IdlMsk2[7]	These bits hold the Receive Idle cell header mask for Octet 2 of the incoming cell.
6	0	IdlMsk2[6]	
5	0	IdlMsk2[5]	
4	0	IdlMsk2[4]	
3	0	IdlMsk2[3]	
2	0	IdlMsk2[2]	
1	0	IdlMsk2[1]	
0	0	IdlMsk2[0]	

0x26—IDLMSK3 (Receive Idle Cell Mask Control Register 3)

The IDLMSK3 register contains the third byte of the Receive Idle Cell Mask. (See 0x24—RXMSKL1.)

Bit	Default	Name	Description
7	0	IdlMsk3[7]	These bits hold the Receive Idle cell header mask for Octet 3 of the incoming cell.
6	0	IdlMsk3[6]	
5	0	IdlMsk3[5]	
4	0	IdlMsk3[4]	
3	0	IdlMsk3[3]	
2	0	IdlMsk3[2]	
1	0	IdlMsk3[1]	
0	0	IdlMsk3[0]	

0x27—IDLMSK4 (Receive Idle Cell Mask Control Register 4)

The IDLMSK4 register contains the fourth byte of the Receive Idle Cell Mask. (See 0x24—RXMSKL1.)

Bit	Default	Name	Description
7	0	IdlMsk4[7]	These bits hold the Receive Idle cell header mask for Octet 4 of the incoming cell.
6	0	IdlMsk4[6]	
5	0	IdlMsk4[5]	
4	0	IdlMsk4[4]	
3	0	IdlMsk4[3]	
2	0	IdlMsk4[2]	
1	0	IdlMsk4[1]	
0	0	IdlMsk4[0]	

0x28—ENCELLT (Transmit Cell Interrupt Control Register)

The ENCELLT register controls which of the interrupts listed in the TxCellInt register (0x2C) appear on the MicroInt* pin (pin T1), provided that both EnTxCellInt (bit 1) in the ENSUMINT register (0x01) and EnPortInt in the ENSUMPORT register (0x0201) for this port are enabled, and EnIntPin (bit 3) in the MODE register (0x0202) is enabled.

Bit	Default	Name	Description
7	1	EnParErrInt	When written to a logical 1, this bit enables the Parity Error Interrupt.
6	1	EnSOCErrInt	When written to a logical 1, this bit enables the Start of Cell Error Interrupt.
5	1	EnTxOvflInt	When written to a logical 1, this bit enables the Transmit FIFO Overflow Interrupt.
4	1	EnRxOvflInt	When written to a logical 1, this bit enables the Receive FIFO Overflow Interrupt.
3	1	EnCellSentInt	When written to a logical 1, this bit enables the Cell Sent Interrupt.
2	1	—	Reserved for factory test, ignore.
1	0	—	Reserved, set to a logical 0.
0	0	—	Reserved, set to a logical 0.

0x29—ENCELLR (Receive Cell Interrupt Control Register)

The ENCELLR register controls which of the interrupts listed in the RxCellInt register (0x2D) appear on the MicroInt* pin (pin T1), provided that both EnRxCellInt (bit 0) in the ENSUMINT register (0x01) and EnPortInt in the ENSUMPORT register (0x0201) for this port are enabled, and EnIntPin (bit 3) in the MODE register (0x0202) is enabled.

Bit	Default	Name	Description
7	1	EnLOCDInt	When written to a logical 1, this bit enables a Loss of Cell Delineation Interrupt.
6	1	EnHECDetInt	When written to a logical 1, this bit enables a HEC Error Detected Interrupt.
5	1	EnHECCorrInt	When written to a logical 1, this bit enables a HEC Error Corrected Interrupt.
4	0	—	Reserved, write to a logical 0.
3	1	EnCellRcvdInt	When written to a logical 1, this bit enables a Cell Received Interrupt.
2	1	EnIdleRcvdInt	When written to a logical 1, this bit enables an Idle Cell Received Interrupt.
1	1	EnNonMatchInt	When written to a logical 1, this bit enables a Non-matching Cell Received Interrupt.
0	1	EnNonZerGFCInt	When written to a logical 1, this bit enables a Non-zero GFC Received Interrupt.

0x2C—TXCELLINT (Transmit Cell Interrupt Indication Status Register)

The TXCELLINT register indicates that a change of status has occurred within the transmit status signals.

Bit	Default	Name	Description
7	—	ParErrInt[1]	When a logical 1 is read, this bit indicates that a Parity Error occurred.
6	—	SOCErrInt[1]	When a logical 1 is read, this bit indicates that a Start of Cell Error occurred.
5	—	TxOvflInt[1]	When a logical 1 is read, this bit indicates that a Transmit FIFO Overflow occurred.
4	—	RxOvflInt[1]	When a logical 1 is read, this bit indicates that a Receive FIFO Overflow occurred.
3	—	CellSentInt[1]	When a logical 1 is read, this bit indicates that a cell has been sent.
2	—	—	Reserved for factory test, ignore.
1	0	—	Reserved, set to a logical 0.
0	0	—	Reserved, write to a logical 0.

FOOTNOTE:
[1] Single event—A 0 to 1 transition on the corresponding status bit causes this interrupt to occur, provided that this interrupt has been enabled by the corresponding enable bit. Reading this interrupt register clears this interrupt.

0x2D—RXCELLINT (Receive Cell Interrupt Indication Status Register)

The RXCELLINT register indicates that a change of status has occurred within the receive status signals.

Bit	Default	Name	Description
7	—	LOCDInt[1]	When a logical 1 is read, this bit indicates that a Loss of Cell Delineation has occurred.
6	—	HECDetInt[2]	When a logical 1 is read, this bit indicates that a HEC Error was detected.
5	—	HECCorrInt[2]	When a logical 1 is read, this bit indicates that a HEC Error was corrected.
4	—	—	Reserved, write to a logical 0.
3	—	CellRcvdInt[2]	When a logical 1 is read, this bit indicates that a cell has been received.
2	—	IdleRcvdInt[2]	When a logical 1 is read, this bit indicates that an Idle Cell has been received.
1	—	NonMatchInt[2]	When a logical 1 is read, this bit indicates that a Non-matching Cell has been received.
0	—	NonZerGFCInt[2]	When a logic 1 is read, this bit indicates that a Non-zero GFC has been received.

FOOTNOTE:
[1] Dual event—Either a 0 to 1 or a 1 to 0 transition on the corresponding status bit causes this interrupt to occur, provided that this interrupt has been enabled by the corresponding enable bit. Reading this interrupt register clears this interrupt.
[2] Single event—A 0 to 1 transition on the corresponding status bit causes this interrupt to occur, provided that this interrupt has been enabled by the corresponding enable bit. Reading this interrupt register clears this interrupt.

0x2E—TXCELL (Transmit Cell Status Register)

The TXCELL register contains status for the cell transmitter. This register is cleared on read.

Bit	Default	Name	Description
7	—	ParErr[1]	When a logical 1 is read, this bit indicates that a parity error was received on the transmit UTOPIA input data octet.
6	—	SOCErr[1]	When a logical 1 is read, this bit indicates that a Start of Cell Error was received on the UTxSOC pin (pin W12).
5	—	TxOvfl[1]	When a logical 1 is read, this bit indicates that a Transmit FIFO Overflow condition occurred in the transmit UTOPIA FIFO.
4	—	RxOvfl[1]	When a logical 1 is read, this bit indicates that a Receive FIFO Overflow condition occurred in the receive UTOPIA FIFO.
3	—	CellSent[1]	When a logical 1 is read, this bit indicates that a non-idle cell was formatted and transmitted.
2	—	—	Reserved for factory test, ignore.
1	0	—	Reserved, set to a logical 0.
0	0	—	Reserved, set to a logical 0.

FOOTNOTE:
[1] This status indicates an event that occurred since the register was last read.

0x2F—RXCELL (Receive Cell Status Register)

The RXCELL register contains status for the cell receiver. This register is cleared on read.

Bit	Default	Name	Description
7	—	LOCD[1]	When a logical 1 is read, this bit indicates a Loss of Cell Delineation.
6	—	HECDet[2]	When a logical 1 is read, this bit indicates that an uncorrected HEC Error was detected.
5	—	HECCorr[2]	When a logical 1 is read, this bit indicates that a HEC Error was corrected.
4	—	—	Reserved, ignore this bit.
3	—	CellRcvd	When logical 1 is read, this bit indicates that a valid cell was received.
2	—	IdleRcvd[2]	When a logical 1 is read, this bit indicates that a cell with a header matching the receive idle cell header value and mask criteria was received.
1	—	NonMatch[2]	When a logical 1 is read, this bit indicates that a cell has been rejected by the cell screening function.
0	—	NonZerGFC[2]	When a logical 1 is read, this bit indicates that a cell with a Non-zero GFC field in the header was received.

FOOTNOTE:
[1] This status reflects the current state of the circuit.
[2] This status indicates an event that occurred since the register was last read.

0x30—IDLCNTL (Idle Cell Receive Counter [Low Byte])

The IDLCNTL counter tracks the number of received idle cells. This byte of the counter should be read first. The counter is cleared on read.

Bit	Default	Name	Description
7	—	IdleCnt[7]	Received cell counter bit 7.
6	—	IdleCnt[6]	Received cell counter bit 6.
5	—	IdleCnt[5]	Received cell counter bit 5.
4	—	IdleCnt[4]	Received cell counter bit 4.
3	—	IdleCnt[3]	Received cell counter bit 3.
2	—	IdleCnt[2]	Received cell counter bit 2.
1	—	IdleCnt[1]	Received cell counter bit 1.
0	—	IdleCnt[0]	Received cell counter bit 0 (LSB).

0x31—IDLCNTM (Idle Cell Receive Counter [Mid Byte])

The IDLCNTM counter tracks the number of received cells. The counter is cleared on read.

Bit	Default	Name	Description
7	—	IdleCnt[15]	Received cell counter bit 15.
6	—	IdleCnt[14]	Received cell counter bit 14.
5	—	IdleCnt[13]	Received cell counter bit 13.
4	—	IdleCnt[12]	Received cell counter bit 12.
3	—	IdleCnt[11]	Received cell counter bit 11.
2	—	IdleCnt[10]	Received cell counter bit 10.
1	—	IdleCnt[9]	Received cell counter bit 9.
0	—	IdleCnt[8]	Received cell counter bit 8.

0x32—IDLCNTH (Idle Cell Receive Counter [High Byte])

The IDLCNTH counter tracks the number of received cells. The counter is cleared on read.

Bit	Default	Name	Description
7	0	—	Reserved, set to a logical 0.
6	0	—	Reserved, set to a logical 0.
5	0	—	Reserved, set to a logical 0.
4	0	—	Reserved, set to a logical 0.
3	0	—	Reserved, set to a logical 0.
2	—	IdleCnt[18]	Received cell counter bit 18 (MSB).
1	—	IdleCnt[17]	Received cell counter bit 17.
0	—	IdleCnt[16]	Received cell counter bit 16.

0x33—LOCDCNT (LOCD Event Counter)

This counter tracks the number of times that cell delineation was lost. Note that the LOCD interrupt is a dual event interrupt and is set when cell delineation is lost or regained. Thus the number of LOCD events will not match the number of LOCD interrupts.

Bit	Default	Name	Description
7	—	LOCDCnt[7]	LOCD Event counter bit 7 (MSB).
6	—	LOCDCnt[6]	LOCD Event counter bit 6.
5	—	LOCDCnt[5]	LOCD Event counter bit 5.
4	—	LOCDCnt[4]	LOCD Event counter bit 4.
3	—	LOCDCnt[3]	LOCD Event counter bit 3.
2	—	LOCDCnt[2]	LOCD Event counter bit 2.
1	—	LOCDCnt[1]	LOCD Event counter bit 1.
0	—	LOCDCnt[0]	LOCD Event counter bit 0 (LSB).

0x34—TXCNTL (Transmitted Cell Counter [Low Byte])

The TXCNTL counter tracks the number of transmitted cells. This byte of the counter should be read first. The counter is cleared on read.

Bit	Default	Name	Description
7	—	TxCnt[7]	Transmitted cell counter bit 7.
6	—	TxCnt[6]	Transmitted cell counter bit 6.
5	—	TxCnt[5]	Transmitted cell counter bit 5.
4	—	TxCnt[4]	Transmitted cell counter bit 4.
3	—	TxCnt[3]	Transmitted cell counter bit 3.
2	—	TxCnt[2]	Transmitted cell counter bit 2.
1	—	TxCnt[1]	Transmitted cell counter bit 1.
0	—	TxCnt[0]	Transmitted cell counter bit 0 (LSB).

0x35—TXCNTM (Transmitted Cell Counter [Mid Byte])

The TXCNTM counter tracks the number of transmitted cells. The counter is cleared on read.

Bit	Default	Name	Description
7	—	TxCnt[15]	Transmitted cell counter bit 15.
6	—	TxCnt[14]	Transmitted cell counter bit 14.
5	—	TxCnt[13]	Transmitted cell counter bit 13.
4	—	TxCnt[12]	Transmitted cell counter bit 12.
3	—	TxCnt[11]	Transmitted cell counter bit 11.
2	—	TxCnt[10]	Transmitted cell counter bit 10.
1	—	TxCnt[9]	Transmitted cell counter bit 9.
0	—	TxCnt[8]	Transmitted cell counter bit 8.

0x36—TXCNTH (Transmitted Cell Counter [High Byte])

The TXCNTH counter tracks the number of transmitted cells. The counter is cleared on read.

Bit	Default	Name	Description
7	0	—	Reserved, set to a logical 0.
6	0	—	Reserved, set to a logical 0.
5	0	—	Reserved, set to a logical 0.
4	0	—	Reserved, set to a logical 0.
3	0	—	Reserved, set to a logical 0.
2	—	TxCnt[18]	Transmitted cell counter bit 18 (MSB).
1	—	TxCnt[17]	Transmitted cell counter bit 17.
0	—	TxCnt[16]	Transmitted cell counter bit 16.

0x37—CORRCNT (Corrected HEC Error Counter)

The CORRCNT counter tracks the number of corrected HEC errors. The counter is cleared on read.

Bit	Default	Name	Description
7	—	CorrCnt[7]	Corrected HEC Error counter bit 7 (MSB).
6	—	CorrCnt[6]	Corrected HEC Error counter bit 6.
5	—	CorrCnt[5]	Corrected HEC Error counter bit 5.
4	—	CorrCnt[4]	Corrected HEC Error counter bit 4.
3	—	CorrCnt[3]	Corrected HEC Error counter bit 3.
2	—	CorrCnt[2]	Corrected HEC Error counter bit 2.
1	—	CorrCnt[1]	Corrected HEC Error counter bit 1.
0	—	CorrCnt[0]	Corrected HEC Error counter bit 0 (LSB).

0x38—RXCNTL (Received Cell Counter [Low Byte])

The RXCNTL counter tracks the number of received cells. This byte of the counter should be read first. The counter is cleared on read.

Bit	Default	Name	Description
7	—	RxCnt[7]	Received cell counter bit 7.
6	—	RxCnt[6]	Received cell counter bit 6.
5	—	RxCnt[5]	Received cell counter bit 5.
4	—	RxCnt[4]	Received cell counter bit 4.
3	—	RxCnt[3]	Received cell counter bit 3.
2	—	RxCnt[2]	Received cell counter bit 2.
1	—	RxCnt[1]	Received cell counter bit 1.
0	—	RxCnt[0]	Received cell counter bit 0 (LSB).

0x39—RXCNTM (Received Cell Counter [Mid Byte])

The RXCNTM register tracks the number of received cells. The counter is cleared on read.

Bit	Default	Name	Description
7	—	RxCnt[15]	Received cell counter bit 15.
6	—	RxCnt[14]	Received cell counter bit 14.
5	—	RxCnt[13]	Received cell counter bit 13.
4	—	RxCnt[12]	Received cell counter bit 12.
3	—	RxCnt[11]	Received cell counter bit 11.
2	—	RxCnt[10]	Received cell counter bit 10.
1	—	RxCnt[9]	Received cell counter bit 9.
0	—	RxCnt[8]	Received cell counter bit 8.

0x3A—RXCNTH (Received Cell Counter [High Byte])

The RXCNTH counter tracks the number of received cells. The counter is cleared on read.

Bit	Default	Name	Description
7	0	—	Reserved, set to a logical 0.
6	0	—	Reserved, set to a logical 0.
5	0	—	Reserved, set to a logical 0.
4	0	—	Reserved, set to a logical 0.
3	0	—	Reserved, set to a logical 0.
2	—	RxCnt[18]	Received cell counter bit 18 (MSB).
1	—	RxCnt[17]	Received cell counter bit 17.
0	—	RxCnt[16]	Received cell counter bit 16.

0x3B—UNCCNT (Uncorrected HEC Error Counter)

The UNCCNT counter tracks the number of uncorrected HEC errors. The counter is cleared on read.

Bit	Default	Name	Description
7	—	UncCnt[7]	Uncorrected HEC Error counter bit 7 (MSB).
6	—	UncCnt[6]	Uncorrected HEC Error counter bit 6.
5	—	UncCnt[5]	Uncorrected HEC Error counter bit 5.
4	—	UncCnt[4]	Uncorrected HEC Error counter bit 4.
3	—	UncCnt[3]	Uncorrected HEC Error counter bit 3.
2	—	UncCnt[2]	Uncorrected HEC Error counter bit 2.
1	—	UncCnt[1]	Uncorrected HEC Error counter bit 1.
0	—	UncCnt[0]	Uncorrected HEC Error counter bit 0 (LSB).

0x3C—NONCNTL (Non-matching Cell Counter [Low Byte])

The NONCNTL counter tracks the number of non-matching cells. This byte of the counter should be read first. The counter is cleared on read.

Bit	Default	Name	Description
7	—	NonCnt[7]	Non-matching cell counter bit 7.
6	—	NonCnt[6]	Non-matching cell counter bit 6.
5	—	NonCnt[5]	Non-matching cell counter bit 5.
4	—	NonCnt[4]	Non-matching cell counter bit 4.
3	—	NonCnt[3]	Non-matching cell counter bit 3.
2	—	NonCnt[2]	Non-matching cell counter bit 2.
1	—	NonCnt[1]	Non-matching cell counter bit 1.
0	—	NonCnt[0]	Non-matching cell counter bit 0 (LSB).

0x3D—NONCNTH (Non-matching Cell Counter [High Byte])

The NONCNTH counter tracks the number of non-matching cells. The counter is cleared on read.

Bit	Default	Name	Description
7	—	NonCnt[15]	Non-matching cell counter bit 15 (MSB).
6	—	NonCnt[14]	Non-matching cell counter bit 14.
5	—	NonCnt[13]	Non-matching cell counter bit 13.
4	—	NonCnt[12]	Non-matching cell counter bit 12.
3	—	NonCnt[11]	Non-matching cell counter bit 11.
2	—	NonCnt[10]	Non-matching cell counter bit 10.
1	—	NonCnt[9]	Non-matching cell counter bit 9.
0	—	NonCnt[8]	Non-matching cell counter bit 8.

0x200—MODE (Device Mode Control Register)

Bit	Default	Name	Description
7	0	DevMstRst	Device master reset. When set high, all internal state machines in the TC block are held in reset and all registers (except this bit) assume their default values.
6	0	DevLgcRst	Device logic reset. When set high, all internal state machines in the TC block are held in reset but register values are unaffected.
5	0	EnStatLat	When set to 1, the one-second status latching is enabled. The value of the status bits are the events which occurred between the last two one-second events. Any events occurring after the last one-second event is not reflected when the status register is read. Those events are reflected in the status register upon the next one-second event. When a status register is read, the status is cleared and is not updated until the next one-second event. When set to 0, the one-second status latching is disabled. The value of a status register is the events occurred since the last read of the status register.
4	0	EnCntrLat	When set to 1, the one-second counter latching is enabled. The value of the counter is the number of events counted between the last two one-second events. Any events occurring after the last one-second event is not reflected when the counter is read. Those events are reflected in the counter upon the next one-second event. When a counter is read, the count is cleared and is not updated until the next one-second event. When set to 0, the one-second counter latching is disabled. The value of a counter is the number of events counted since the last read of the counter.
3	0	EnIntPin	Enables the MicroInt* output pin.
2–1	00	—	Reserved, set to zero.
0	0	OneSecOut	When set to 1, the OneSecIO pin is configured as an output. The pin provides a one-second event pulse. The one-second event is generated internally of the device. The event occurs after the device has counted 8000 periods of a 8 KHz clock. When set to 0, the OneSecIO pin is configured as an input. The one-second event must be genetared externally, by pulsing the OneSecIO pin for low-high-low.

0x201—PHYINTFC (PHY-side Interface Control Register)

Bit	Default	Name	Description
7	0	—	Reserved, set to 0.
6	1	DisTCUtopia	When set to 1, the internal IMA/TC UTOPIA interface is disabled.
5–0	000000	—	Reserved, set to zero.

0x202—ATMINTFC (ATM-side Interface Control Register)

Bit	Default	Name	Description
7–6	11	ATMmux[1:0]	Controls the ATM-side UTOPIA interface mux. 00 – External interface is placed in Tristate mode. 01 – Utopia level 2 interface to IMA32 block is enabled. 10 – Utopia level 2 interface to TC block is enabled. 11 – External interface is placed in Tristate mode.
5	0	BusWidth	When set to 0, the 16-bit UTOPIA bus is enabled. When set to 1, the 8-bit UTOPIA bus is enabled. When the ATM UTOPIA interface to IMA32 block is enabled (ATMmux[1:0] = "01"), this bit controls the bus width of the IMA32 core ATM-side UTOPIA interface. In this case, the TC ATM-side UTOPIA interface is always 8-bit. When the ATM UTOPIA interface to TC block is enabled, (ATMmux[1:0] = "10"), this bit controls the bus width of the TC ATM-side UTOPIA interface.
4	0	—	Reserved, set to zero.
3	0	—	Reserved, set to zero.
2–0	000	—	Reserved, set to zero.

0x203—OUTSTAT (Output Status Control Register)

Bit	Default	Name	Description
7–2	000000	—	Reserved, set to zero.
1–0	00	StatOut[1:0]	The value written into these bits will be asserted on the StatOut[1:0] output pins.

0x204—SUMPORT (Summary Port Interrupt Status Register)

Bit	Default	Name	Description
7	0	PortInt[7][1]	This bit is a summary indicator of the interrupts from the Port 7 SUMINT register (0x1C0).
6	0	PortInt[6][1]	This bit is a summary indicator of the interrupts from the Port 6 SUMINT register (0x180).
5	0	PortInt[5][1]	This bit is a summary indicator of the interrupts from the Port 5 SUMINT register (0x140).
4	0	PortInt[4][1]	This bit is a summary indicator of the interrupts from the Port 4 SUMINT register (0x100).
3	0	PortInt[3][1]	This bit is a summary indicator of the interrupts from the Port 3 SUMINT register (0x0C0).
2	0	PortInt[2][1]	This bit is a summary indicator of the interrupts from the Port 2 SUMINT register (0x080).
1	0	PortInt[1][1]	This bit is a summary indicator of the interrupts from the Port 1 SUMINT register (0x040).
0	0	PortInt[0][1]	This bit is a summary indicator of the interrupts from the Port 0 SUMINT register (0x000).

FOOTNOTE:
[1] This bit is a pointer to the next interrupt indication register to be read. This bit will be cleared when the interrupt bit in the corresponding interrupt indication register is read and automatically cleared.

0x205—ENSUMPORT (Summary Port Interrupt Control Register)

Bit	Default	Name	Description
7	1	EnPortInt[7]	When set, this bit enables PortInt[7] to appear on the MicroInt* output.
6	1	EnPortInt[6]	When set, this bit enables PortInt[6] to appear on the MicroInt* output.
5	1	EnPortInt[5]	When set, this bit enables PortInt[5] to appear on the MicroInt* output.
4	1	EnPortInt[4]	When set, this bit enables PortInt[4] to appear on the MicroInt* output.
3	1	EnPortInt[3]	When set, this bit enables PortInt[3] to appear on the MicroInt* output.
2	1	EnPortInt[2]	When set, this bit enables PortInt[2] to appear on the MicroInt* output.
1	1	EnPortInt[1]	When set, this bit enables PortInt[1] to appear on the MicroInt* output.
0	1	EnPortInt[0]	When set, this bit enables PortInt[0] to appear on the MicroInt* output.

0x208—PART/VER (Part Number/Version Register)

Bit	Default	Name	Description
7–4	pppp	PartNum[3:0]	Part number controlled by bondout: IMA2 – 0100 IMA4 – 0101 IMA8/32 – 1001
3–0	0001	Version[3:0]	Version number of the device. 0001—Version -11 0010—Version -12 0011—Version -13 0100—Version -14

7.1 IMA Subsystem Registers

The IMA Subsystem layer contains configuration and status information that is common to all IMA groups.

0x400—IMA_VER_1_CONFIG (IMA Type and Version Code I)

The IMA_Version I and II registers contain the type and revision level of the IMA core. **Read-only**.

Bit	Default	Name	Description
7–4		IMA Core Type I	0x0 = CX28224, 2 ports 2 IMA groups 0x2 = CX28225, 4 ports 4 IMA groups 0x8 = CX28229, 32 ports 16 IMA groups
3	1	IMA Core Type II	1 = Internal memory present
2–0		Version Code I	0x4 = CX2822x family major revision level

0x401—IMA_VER_2_CONFIG (IMA Version Codes II and III)

This register is **read-only**.

Bit	Default	Name	Description
7–4		Version Code II	4 bit code: 0x2 = CX2822x-13 and earlier 0x3 = CX2822x-14
3–0		Version Code III	4 bit code: CX2822x-11 = 0 CX2822x-12 = 3 CX2822x-13 = 4 CX2822x-14 = 0

0x402—IMA_SUBSYS_CONFIG (IMA Configuration Control)

This register contains some of the basic IMA Subsystem configuration.

Bit	Default	Name	Description
7–6	0	Link Type	Sets default link type for all IMA groups. Not used with variable rate facilities 0 = T1 1 = E1 2 = Alternate T1 (1.544 Mbps payload) 3 = Alternate E1 (1.984 Mbps payload)
5–4	0	SRAM size	0 = 25 ms (E1 mode) 1 = 50 ms 2 = 100 ms 3 = 200 ms
3	0	Number of SRAMs	0 = 1 SRAM, Set to 0 for all CX2822X devices
2–0	0	Number of Ports	This field indicates the range of valid PHY addresses. 0: addresses 0x00–0x03 are valid 1: addresses 0x00–0x07 are valid 2: addresses 0x00–0x0B are valid 3: addresses 0x00–0x0F are valid 4: addresses 0x00–0x13 are valid 5: addresses 0x00–0x17 are valid 6: addresses 0x00–0x1B are valid 7: addresses 0x00–0x1F are valid This field has different ranges depending on Product type: CX28224: Unused, Set to 0 CX28225: Unused, Set to 0 CX28229: Range: 0–7

0x403—IMA_MISC_STATUS (IMA Miscellaneous Status)

This register contains miscellaneous status information for the IMA Subsystem. **Read-only**.

Bit	Default	Name	Description
7	—	State of TxAddr[4]	This bit is the current state of the signal ATMUTxAddr[4].
6	—	State of RxAddr[4]	This bit is the current state of the signal ATMURxAddr[4].
5	—	—	Reserved
4	—	ATM Data Width	This bit indicates whether the ATM Utopia bus is operating in 16 bit (high) or 8 bit (low) data mode.
3	—	IMA_RefClk Error	This bit is set high if a transition detector for IMA_RefClk detects a bad signal. This bit is active high and is reset upon reading this address.
2	—	Tx ATM Parity Error	This bit indicates that a parity error has been detected on the Transmit ATM side Utopia bus. This bit is active high and is reset upon reading this address.
1	—	—	Reserved.
0	—	Rx PHY Parity Error	This bit indicates that a parity error has been detected on the Receive PHY side cell bus. This bit is active high and is reset upon reading this address.

0x404—IMA_MISC_CONFIG (IMA Miscellaneous Control)

This register contains some of the basic IMA Subsystem configuration.

Bit	Default	Name	Description
7	—	—	Reserved. Set to 0
6	0	Alternate GTSM Mode	1 = When the GTSM is down, ATMUTxCIAv for that group is controlled as if all configured links in the group are Active. 0 = When the GTSM is down, ATMUTxCIAv for that group is inactive.

5–4	0	PHY Size	This two bit field determines the use of the PHY side CIAv and En* signals
			    0 = CIAv and En* for every 4 PHY addresses (support 8 ports total)
			    1 = CIAv and En* for every 16 PHY addresses (support 32 ports total)
			    2 = CIAv and En* for all PHY addresses (support 32 ports total)
			    3 = CIAv and En* for every 8 PHY addresses (support 16 ports total)

3	0	Enable External HEC Checker	1 = Bit 7 of the HEC Byte is a HEC error flag 0 = Use the HEC Error checker within the IMA block
2	0	Check ATMUTxAddr[4] and ATMURxAddr[4]	0 = mask bits (don't care) 1 = Check ATMUTxAddr[4] and TMURxAddr[4] for correct value
1	0	Check ATMUTxAddr[3] and ATMURxAddr[3]	0 = mask bits (don't care) 1 = Check ATMUTxAddr[3] and ATMURxAddr[3] for correct value
0	0	Check ATMUTxAddr[2] and ATMURxAddr[2]	0 = mask bits (don't care) 1 = Check ATMUTxAddr[2] and ATMURxAddr[2] for correct value

0x405—IMA_MEM_LOW_TEST (IMA Memory Test Address (Bits 0–7))

Registers 0x405—0x408 are used to perform memory diagnostic tests on the internal or external differential delay SRAM.

Bit	Default	Name	Description
7–0	0x00	Memory Test Address	This field contains the least significant bits of the memory test address for the selected memory component. Range: 0x00–0xFF

0x406—IMA_MEM_HI_TEST (IMA Memory Test Address (Bits 8–15))

Bit	Default	Name	Description
7–0	0x00	Memory Test Address	This field contains the middle significant bits of the memory test address for the selected memory component. Range: 0x00–0xFF

0x407—IMA_MEM_TEST_CTL (IMA Memory Test Control / Address MSBs)

Bit	Default	Name	Description
7	0	Memory Test Address Bit 20	This field contains the most significant bit of the memory test address for the selected memory component.
6–4	0	RAM Test Access	0 = no test selected, normal operation 1 = SRAM Test 2–7 = Reserved
3–0	0	Memory Test Address Bits 19–16	This field contains the most significant bits of the memory test address for the selected memory component. Range: 0x00–0x0F

0x408—IMA_MEM_TEST_DATA (IMA Memory Test Data)

Bit	Default	Name	Description
7–0	0x00	Memory Test Data	This field contains the data to be written or read from the memory test address for the selected memory component. Range: 0x00–0xFF

0x409—IMA_LNK_DIAG_CTL (IMA Link Diagnostic Control Register)

This register is used to specify a port number for observation of link differential delay and anomalies. The contents of this register are used to report the link information via registers 0x409–0x40B. Bit 5 of this register is **read-only**.

Bit	Default	Name	Description
7	—	—	Reserved. Set to 0
6	—	—	Reserved. Set to 0
5	—	Link Delay Write Counter	This field contains the most significant bit of the SRAM write counter for the diagnostic link (selected using the field below).
4–0	0x00	Link Diagnostic PHY Address	This field contains the PHY Cell Bus Address of the port for which a diagnostic measurement is to be performed. Range: 0x00–0x1F

0x40A—IMA_LNK_DIFF_DEL (IMA Link Differential Delay Write Counter)

This register, along with bit 5 of address 0x409, reports the value of the SRAM write phase at the time when the read phase is 0. This phase information is used to calculate the link differential delay.

Bit	Default	Name	Description
7–0	—	Link Delay Write Counter	This field contains a snapshot of 8 of the least significant bits of the SRAM write counter for the diagnostic link (selected using address 0x409). All others (Range: 0x00–0xFF) Delay Window = 0 (see register 0x415): Value = Cell_count >> 1 Delay Window = 1–3 (see register 0x415): Value = Cell_count Delay Window = 4 (see register 0x415): Value = Cell_count >> 2

0x40B—IMA_RCV_LNK_ANOMALIES (IMA Receive Link Anomalies)

These anomalies are for the diagnostic link selected using address 0x409. The bits in this register are **read-only** and are cleared upon read.

Bit	Default	Name	Description
7	—	ICP-ERR Anomaly	1 = ICP-ERR anomaly was active sometime since the last time this register was read 0 = ICP-ERR defect was inactive
6	—	ICP-INV Anomaly— Unexpected IMA Label	1 = Unexpected IMA Label condition of the ICP-INV anomaly was active sometime since the last time this register was read 0 = Unexpected IMA Label condition was inactive
5	—	ICP-INV Anomaly— Unexpected LID	1 = Unexpected LID condition of the ICP-INV anomaly was active sometime since the last time this register was read 0 = Unexpected LID condition was inactive
4	—	ICP-INV Anomaly— Unexpected IMA ID	1 = Unexpected IMA ID condition of the ICP-INV anomaly was active sometime since the last time this register was read 0 = Unexpected IMA ID condition was inactive
3	—	ICP-INV Anomaly— Unexpected M	1 = Unexpected M condition of the ICP-INV anomaly was active sometime since the last time this register was read 0 = Unexpected M condition was inactive
2	—	ICP-INV Anomaly— Unexpected IMA Frame Number	1 = Unexpected IMA Frame Number condition of the ICP-INV anomaly was active sometime since the last time this register was read 0 = Unexpected IMA Frame Number condition was inactive
1	—	ICP-INV Anomaly— Unexpected IMA Cell Offset	1 = Unexpected IMA Cell Offset condition of the ICP-INV anomaly was active sometime since the last time this register was read 0 = Unexpected IMA Cell Offset condition was inactive
0	—	ICP-MIS Anomaly	1 = ICP-MIS anomaly was active sometime since the last time this register was read 0 = ICP-MIS defect was inactive

0x40E—IMA_DIAG_XOR_BIT (IMA Diagnostic Bit)

This register provides a single bit that can be used by a diagnostic test routine to verify the connectivity of the microprocessor address lines to the IMA device. This bit is **read-only**.

Bit	Default	Name	Description
7	—	—	Reserved.
6	—	—	Reserved.
5	—	—	Reserved.
4	—	—	Reserved.
3	—	—	Reserved.
2	—	—	Reserved.
1	—	—	Reserved.
0	—	Address Diagnostic Bit	Exclusive OR of address bits from previous IMA core access. The number of bits in the exclusive OR operation is 10.

0x40F—IMA_DIAG (IMA Diagnostic Register)

This register provides an isolated 8 bit storage register that can be used by a diagnostic test routine to verify the connectivity of the microprocessor data lines to the IMA device.

Bit	Default	Name	Description
7–0	0x00	Data Diagnostic Register	An 8 bit register that can be written and read by the processor. The register is not used within the IMA Block.

0x410—IMA_TIM_REF_MUX_CTL_ADDR (IMA Timing Reference Multiplexer Control Address)

This register is used in conjunction with 0x411 to configure various timing elements within the IMA core. Register 0x410 and 0x411 are an indirect register pair in that a particular timing element is selected using register 0x410 and the configuration for that timing element is programmed using register 0x411.

Bit	Default	Name	Description
7–6	0	Multiplexer Type	0 = Set timing reference for a Rx IMA Group 1 = Set timing reference for a Tx IMA Group 2 = Set timing source for Tx_TRL Outputs 3 = Set the Clock Divisor for an IMA group
5	—	—	Reserved. Set to 0.
4	—	—	Reserved. Set to 0.
3–0	0	Multiplexer ID	For Multiplexer Type = 0, Multiplexer Type = 1, and Multiplexer Type = 3: CX28224: 0–1: IMA Group 1–2 CX28225: 0–3: IMA Group 1–4 CX28229: 0–0xF: IMA Group 1–16 For Multiplexer Type = 2: 0–1: Tx_TRL[0]–Tx_TRL[1] output

0x411—IMA_TIM_REF_MUX_CTL_DATA (IMA Timing Reference Multiplexer Control Data)

Bit	Default	Name	Description
7	—	—	Reserved. Set to 0.
6	—	—	Reserved. Set to 0.
For Multiplexer Type 0 and 1			
5–0	0x00	Timing Source	0x00–0x1F: Select timing from a Receive Port (see register 0x416) CX28224: 0–1: Port 0–1 CX28225: 0–3: Port 0–3 CX28229: 0–0x1F: Port 0–31 0x20: Use IMA_SysClk/24 or DSL generator output as source (see register 0x416) 0x21: Use IMA_RefClk as source
For Multiplexer Type 2			
5–0	0x00	Timing Source	0x00–0x1F: Select timing from a Receive Port (see register 0x416) CX28224: 0–1: Port 0–1 CX28225: 0–3: Port 0–3 CX28229: 0–0x1F: Port 0–31 0x20: Use IMA_SysClk/24 0x21: Use IMA_RefClk as source 0x22: Use 8 kHz as source
For Multiplexer Type 3			
5	—	—	Reserved. Set to 0.
4	—	—	Reserved. Set to 0.
3–0	0x0	Clock Divisor	This field contains the clock divider multiplier for the group. The IMA group number is set by writing to the Multiplexer ID field in address 0x410. 0 = Based on Link Type field in address 0x002 1 = 1/1 2 = 192/193 3 = 15/16

0x412—IMA_RX_PERSIST_CONFIG (IMA Receive Persistence Configuration)

Bit	Default	Name	Description
7	0	—	Reserved. Set to 0.
6	0	Alpha Value[1]	0: α = 1 1: α = 2
5–3	0	Beta Value[2]	0: β = 1 1: β = 2 2: β = 3 3: β = 4 4: β = 5
2–0	0	Gamma Value[3]	0: γ = 1 1: γ = 2 2: γ = 3 3: γ = 4 4: γ = 5

FOOTNOTE:
[1] The Alpha Value is the number of consecutive invalid ICP cells needed for the link to leave the IMA Sync state.
[2] The Beta Value is the number of consecutive errored ICP cells needed for the link to leave the IMA Sync state.
[3] The Gamma Value is the number of consecutive valid ICP cells needed for the link to enter the IMA Sync state.

0x413—IMA_ATM_UTOPIA_BUS_CTL (IMA ATM Utopia Bus Control)

This register configures the operation of the ATM side UTOPIA bus and the sample time of PhyUTxClAv for an IMA group.

Bit	Default	Name	Description
7	—	—	Reserved. Set to 0.
6	0	ATM Address Mode	0 = Utopia Level 2 (multiple addresses) 1 = Utopia Level 1 (single fixed address, no address latching)
5	0	ATMURxSOC Three-state Disable	0 = ATMURxSOC, ATMURxData[], and ATMURxPrty three-state when not selected 1 = ATMURxSOC, ATMURxData[], and ATMURxPrty do not three-state
4	0	ATMURxClAv Mode	0 = ATMURxClAv is set active for selected channel during cell transfer 1 = ATMURxClAv is set inactive for selected channel during cell transfer
3	0	ATMUTxClAv Last 4 Bytes/Words Mode	0 = ATMUTxClAv is forced inactive/active (based on the state of bit 2) during last 4 bytes/words for selected channel during cell transfer 1 = ATMUTxClAv reflects true cell available status during last 4 bytes/words for selected channel during cell transfer
2	0	ATMUTxClAv Mode	0 = ATMUTxClAv is set inactive for selected channel during cell transfer 1 = ATMUTxClAv is set active for selected channel during cell transfer
1	0	ClAv Three-state Disable	0 = ATMURxClAv and ATMUTxClAv threestate when not selected 1 = ATMURxClAv and ATMUTxClAv do not threestate
0	0	PHYUTxClAv Sample Time	0 = For an IMA group, sample PhyUTxClAv during an ICP cell to determine SICP rate 1 = For an IMA group, delay sampling PhyUTxClAv until >5 payload byte periods after an ICP transfer

0x414—IMA_DIFF_DELAY_ADDR (IMA Differential Delay Control Address)

This register is used in conjunction with 0x415 to configure the differential delay operation of the IMA core. Register 0x414 and 0x415 are an indirect register pair in that a particular IMA group is selected using register 0x414 and the configuration for that IMA group is programmed using register 0x415.

Bit	Default	Name	Description
7	—	—	Reserved. Set to 0.
6	0	Control Type	0 = Set Delay Threshold for an IMA group 1 = Set Delay Window for an IMA group
5	—	—	Reserved. Set to 0.
4	—	—	Reserved. Set to 0.
3–0	0x0	Group Number	CX28224: 0–1: IMA Group 1–2 CX28225: 0–3: IMA Group 1–4 CX28229: 0–0xF: IMA Group 1–16

0x415—IMA_DIFF_DELAY_DATA (IMA Differential Delay Control Data)

Bit	Default	Name	Description
For Control Type = 0			
7–0	0x00	Differential Delay Threshold	This field contains the cell offset that corresponds to differential delay threshold setting for the group. Delay Window = 0, 5: Value = 255–(Cell_count >> 1) Delay Window = 1–3, 6–7: Value = 255–Cell_count Delay Window = 4: Value = 255–(Cell_count >> 2)
For Control Type = 1			
7	—	—	Reserved. Set to 0.
6	—	—	Reserved. Set to 0.
5	—	—	Reserved. Set to 0.
4	—	—	Reserved. Set to 0.
3	—	—	Reserved. Set to 0.
2–0		Delay Window	This field contains the number of IMA frames (assuming M=128) that are examined when setting the differential delay buffer. This field is set based on the facility payload rate. 0 = 8 frames (1024 cells), for payload rates ≥ 1024 kbps 1 = 4 frames (512 cells), for 1024 kbps > payload rates ≥ 512 kbps 2 = 2 frames (256 cells), for 512 kbps > payload rates ≥ 256 kbps 3 = 1 frame (128 cells), for payload rates < 256 kbps 4 = 16 frames (2048 cells), for payload rates ≥ 1024 kbps 5 = 8 frames (1024 cells), for 1024 kbps > payload rates ≥ 512 kbps 6 = 4 frames (512 cells), for 512 kbps > payload rates ≥ 256 kbps 7 = 2 frame (256 cells), for payload rates < 256 kbps

0x416—IMA_DSL_CLOCK_GEN_ADDR (IMA DSL Clock Generator Control)

This register is used in conjunction with 0x417 to configure the operation of the DSL Clock Generator in the IMA core. Register 0x416 and 0x417 are an indirect register pair in that a particular clock generator element is selected using register 0x416 and the configuration for that element is programmed using register 0x417.

The overall operation of the clock generators are governed by the following equations:

◆ Prescaler Factor = Prescaler Numerator / (Prescaler Terminal Count + 1)
◆ Intermediate Frequency = Reference Clock Frequency * Prescaler Factor
◆ Reference Denominator = 257 + Reference Clock Divisor
◆ 8 kHz = Intermediate Frequency / (Reference Denominator)

Link Payload Rate = 8 kbps * (Multiplier Factor)

A further constraint is:

◆ Maximum Link Payload Rate ≤ Intermediate Frequency ≤ IMA_SysClk/16

In a typical G.shdsl application, Intermediate Frequency is set to 2.56 MHz and the Reference Denominator is set to 320. Other settings are possible as long as the above equations and constraints are met.

Bit	Default	Name	Description
7–5	0	Control Type	0 = Basic Setup 1 = Pre-scaler Terminal Count 2 = Pre-scaler Numerator 3 = Reference Divisor 4 = IMA Group Factor LSBs 5 = IMA Group Factor MSB 6 = Rx Timing Synthesizer Factor LSBs 7 = Rx Timing Synthesizer Factor MSB
For Control Type = 0, 1, 2, 3			
4–0	—	—	Reserved. Set to 0.
For Control Type = 4, 5			
4	0	Transmit / Receive	0 = Receive IMA Group 1 = Transmit IMA Group
3–0	0x0	Group Number	CX28224: 0–1: IMA Group 1–2 CX28225: 0–3: IMA Group 1–4 CX28229: 0–0xF: IMA Group 1–16
For Control Type = 6, 7			
4–0	0x00	Port Number	CX28224: 0–1: Port 0–1 CX28225: 0–3: Port 0–3 CX28229: 0–0x1F: Port 0–31

0x417—IMA_DSL_CLOCK_GEN_DATA (IMA_DSL Clock Generator Data)

This register is used in conjunction with 0x416 to configure the operation of the DSL Clock Generator in the IMA core. Register 0x416 and 0x417 are an indirect register pair in that a particular clock generator element is selected using register 0x416 and the configuration for that element is programmed using register 0x417.

Bit	Default	Name	Description
For Control Type = 0			
7	—	—	Reserved. Set to 0.
6	0	EnRxSyn	Enable Rx Timing Synthesizers 0 = Use SPRxClk inputs 1 = Use synthesizers instead of SPRxClk inputs
5	0	DSLClkGen	Substitute DSL clock generator 0 = Use IMA_SysClk/24 in IMA group clock and Tx_TRL selectors 1 = Use DSL Clock generator outputs when Timing Source is set to 0x20 in register 0x411.
4	0	IMA_ClkSel	0 = Use IMA_SysClk as input to DSL Clock Generators 1 = Use IMA_RefClk as input to DSL Clock Generators
3–0	—	—	Reserved. Set to 0.
For Control Type = 1			
7–0	0x00	Pre-scaler Terminal Count	This field contains the terminal count of the pre-scaler clock divider. The pre-scaler denominator is the value of this field plus 1.
For Control Type = 2			
7–0	0x00	Pre-scaler Numerator	This field contains the numerator for the pre-scaler.
For Control Type = 3			
7–0	0x00	Reference Clock Divisor	This field contains 8 of the 9 bits of the terminal count for the reference clock divisor. The reference clock divisor counts from 0 to the terminal count which is given by the value of this field plus 257. As an example if the value of this register is 63 decimal, then the reference clock divisor will be 320.
For Control Type = 4			
7–0	0x00	Group Clock Multiplier Factor (lsbs)	This register contains the 8 lsbs of the payload bandwidth for the ports used in the IMA group. The contents of this register are multiplied by 8kbps in order to obtain the bandwidth.
For Control Type = 5			
7–1	—	—	Reserved. Set to 0.
0	0	Group Clock Multiplier Factor (msb)	This register contains the msb of the payload bandwidth for the ports used in the IMA group. The contents of this register are multiplied by 2048kbps in order to obtain the bandwidth.
For Control Type = 6			
7–0	0x00	Port Clock Multiplier Factor (lsbs)	This register contains the 8 lsbs of the payload bandwidth for the specific port of the Rx Timing clock synthesizer. The contents of this register are multiplied by 8kbps in order to obtain the bandwidth.

Bit	Default	Name	Description (Continued)
For Control Type = 7			
7–1	—	—	Reserved. Set to 0.
0	0	Port Clock Multiplier Factor (msb)	This register contains the msb of the payload bandwidth for the specific port of the Rx Timing clock synthesizer. The contents of this register are multiplied by 2048kbps in order to obtain the bandwidth.

0x418—IMA_RX_TRANS_TABLE (IMA Receive Translation Table Address)

This register is used in conjunction with 0x419 for configure the translation between the ATM side Utopia addresses and the internal channels (bypass ports and IMA groups) associated with the IMA core. Register 0x418 and 0x419 are an indirect register pair in that a address is selected using register 0x418 and the configuration for that address is programmed using register 0x419.

Bit	Default	Name	Description
7		Translation Type	0 = the value in bits 5–0 enables ATM address –> IMA internal channel translations 1 = the value in bits 5–0 enables IMA internal channel –> ATM address translations
6	—	—	Don't care. Ignore.
For Translation Type = 0			
5	—	—	Don't care. Ignore.
4–0		ATM Utopia Address	For Type 0, this field contains the ATM Side Utopia address. Range: 0x00–0x1F
For Translation Type = 1			
5–0		Internal IMA Channel	For Type 1, this field contains the IMA internal channel address. Range 0x00–0x1F: Bypass Receive Port CX28224: 0–1: Port 0–1 CX28225: 0–3: Port 0–3 CX28229: 0–0x1F: Port 0–31 Range 0x20–0x2F: IMA Group CX28224: 0x20–0x21: IMA Group 1–2 CX28225: 0x20–0x23: IMA Group 1–4 CX28229: 0x20–0x2F: IMA Group 1–16

0x419—IMA_RX_ATM_TRANS_TABLE (IMA Receive ATM Translation Table Internal Channel)

This register is used in conjunction with 0x418 for configure the translation between the ATM side Utopia addresses and the internal channels (bypass ports and IMA groups) associated with the IMA core. Register 0x418 and 0x419 are an indirect register pair in that an address is selected using register 0x418 and the configuration for that address is programmed using register 0x419.

Bit	Default	Name	Description
For Translation Type = 0			
7	—	—	Don't care. Ignore.
6	—	—	Don't care. Ignore.

5–0		Internal IMA Channel	This field contains the mapping for the ATM Utopia address set in register 0x418. Range 0x00–0x1F: Bypass Receive Port
			    CX28224: 0–1: Port 0–1
			    CX28225: 0–3: Port 0–3
			    CX28229: 0–0x1F: Port 0–31
			Range 0x20–0x2F: IMA Group
			    CX28224: 0x20–0x21: IMA Group 1–2
			    CX28225: 0x20–0x23: IMA Group 1–4
			    CX28229: 0x20–0x2F: IMA Group 1–16
			0x30
			    All devices: ATM address is not assigned to this device

For Translation Type = 1			
7		Channel Active	1 = Internal Channel Active 0 = Internal Channel Inactive
6	—	—	Don't care. Ignore.
5	—	—	Don't care. Ignore.
4–0		ATM Utopia Address	This field contains the mapping for the Internal IMA channel set in register 0x418. Range: 0x00–0x1F

0x41B—IMA_TX_TRANS_TABLE (IMA Transmit Translation Table Address)

This register is used in conjunction with 0x41C for configure the translation between the ATM side Utopia addresses and the internal channels (bypass ports and IMA groups) associated with the IMA core. Register 0x41B and 0x41C are an indirect register pair in that a address is selected using register 0x41B and the configuration for that address is programmed using register 0x41C.

Bit	Default	Name	Description
7		Translation Type	0 = the value in bits 5–0 enables ATM address –> IMA internal channel translations 1 = the value in bits 5–0 enables IMA internal channel –> ATM address translations
6	—	—	Don't care. Ignore.
For Translation Type = 0			
5	—	—	Don't care. Ignore.
4–0		ATM Utopia Address	For Type 0, this field contains the ATM Side Utopia address. Range: 0x00–0x1F
For Translation Type = 1			
5–0		Internal IMA Channel	For Type 1, this field contains the IMA internal channel address. Range 0x00–0x1F: Bypass Transmit Port CX28224: 0–1: Port 0–1 CX28225: 0–3: Port 0–3 CX28229: 0–0x1F: Port 0–31 Range 0x20–0x2F: IMA Group CX28224: 0x20–0x21: IMA Group 1–2 CX28225: 0x20–0x23: IMA Group 1–4 CX28229: 0x20–0x2F: IMA Group 1–16

0x41C—IMA_TX_ATM_TRANS_TABLE (Transmit ATM Translation Table Internal Channel)

This register is used in conjunction with 0x41B for configure the translation between the ATM side Utopia addresses and the internal channels (bypass ports and IMA groups) associated with the IMA core. Register 0x41B and 0x41C are an indirect register pair in that a address is selected using register 0x41B and the configuration for that address is programmed using register 0x41C.

Bit	Default	Name	Description
For Translation Type = 0			
7	—	—	Don't care. Ignore.
6	—	—	Don't care. Ignore.
5–0		Internal IMA Channel	This field contains the mapping for the ATM Utopia address set in register 0x41B. Range 0x00–0x1F: Bypass Transmit Port 　　CX28224: 0–1: Port 0–1 　　CX28225: 0–3: Port 0–3 　　CX28229: 0–0x1F: Port 0–31 Range 0x20–0x2F: IMA Group 　　CX28224: 0x20–0x21: IMA Group 1–2 　　CX28225: 0x20–0x23: IMA Group 1–4 　　CX28229: 0x20–0x2F: IMA Group 1–16 0x30 　　All devices: ATM address is not assigned to this device
For Translation Type = 1			
7		Channel Active	1 = Internal Channel Active 0 = Internal Channel Inactive
6	—	—	Don't care. Ignore.
5	—	—	Don't care. Ignore.
4–0		ATM Utopia Address	This field contains the mapping for the Internal IMA channel set in register 0x41B. 　　Range: 0x00–0x1F

0x458—IMA_RX_SOC_DETECTOR (PHY Utopia RX_SOC Detector)

This register is used to monitor phyURxSOC for conditions where a cell transfer occurs without an assertion of the Start-of-cell signal. Use of this register requires first setting the port address in bits 4–0 and then reading the state of the Loss-of-start-of-cell in bit 7.

Bit	Default	Name	Description
7	—	Loss of Start of Cell	This bit indicates that a cell transfer occurred for the selected port and phyURxSOC was not asserted. This occurrence is saved internally until the state is read using this register. The read operation will clear the internal state.
6	—	—	Reserved. Set to 0.
5	—	—	Reserved. Set to 0.
4–0	0x00	Port Number	This field contains the PHY Cell Bus Address of the SOC being examined CX28224: 0–1: Port 0–1 CX28225: 0–3: Port 0–3 CX28229: 0–0x1F: Port 0–31

7.2 IMA Group

The IMA Group layer contains configuration and status information that is associated with IMA groups.

0x41F—IMA_GRP_1TO4_SEM (Group Table Control I)

For the following bits, 1 = the group table is being updated, 0 = the group table is not being updated. The update enable must be set to 1 prior to writing the group table. All elements of the group table must be re-written. After writing to all 8 elements, the update enable is reset to 0. The group tables are described below.

NOTE: This register cannot be read back.

Bit	Default	Name	Description
7	0	Update Enable for Receive group 4	addresses 0x4DC–0x4DF (Not defined for CX28224)
6	0	Update Enable for Receive group 3	addresses 0x4D8–0x4DB (Not defined for CX28224)
5	0	Update Enable for Receive group 2	addresses 0x4D4–0x4D7
4	0	Update Enable for Receive group 1	addresses 0x4D0–0x4D3
3	0	Update Enable for Transmit group 4	addresses 0x438–0x43F (Not defined for CX28224)
2	0	Update Enable for Transmit group 3	addresses 0x430–0x437 (Not defined for CX28224)
1	0	Update Enable for Transmit group 2	addresses 0x428–0x42F
0	0	Update Enable for Transmit group 1	addresses 0x420–0x427

0x51F—IMA_GRP_5TO8_SEM (Group Table Control II (CX28229 Only))

For the following bits, 1 = the group table is being updated, 0 = the group table is not being updated. The update enable must be set to 1 prior to writing the group table. All elements of the group table must be re-written. After writing to all 8 elements, the update enable is reset to 0. The group tables are described below.

NOTE: This register cannot be read back.

Bit	Default	Name	Description
7	0	Update Enable for Receive group 8	addresses 0x5DC–0x5DF (Not defined for CX28224 and CX28225)
6	0	Update Enable for Receive group 7	addresses 0x5D8–0x5DB (Not defined for CX28224 and CX28225)
5	0	Update Enable for Receive group 6	addresses 0x5D4–0x5D7 (Not defined for CX28224 and CX28225)
4	0	Update Enable for Receive group 5	addresses 0x5D0–0x5D3 (Not defined for CX28224 and CX28225)
3	0	Update Enable for Transmit group 8	addresses 0x538–0x53F (Not defined for CX28224 and CX28225)
2	0	Update Enable for Transmit group 7	addresses 0x530–0x537 (Not defined for CX28224 and CX28225)
1	0	Update Enable for Transmit group 6	addresses 0x528–0x52F (Not defined for CX28224 and CX28225)
0	0	Update Enable for Transmit group 5	addresses 0x520–0x527 (Not defined for CX28224 and CX28225)

0x61F—IMA_GRP_9TO12_SEM (Group Table Control III (CX28229 Only))

For the following bits, 1 = the group table is being updated, 0 = the group table is not being updated. The update enable must be set to 1 prior to writing the group table. All elements of the group table must be re-written. After writing to all 8 elements, the update enable is reset to 0. The group tables are described below.

NOTE: This register cannot be read back.

Bit	Default	Name	Description
7	0	Update Enable for Receive group 12	addresses 0x6DC–0x6DF (Not defined for CX28224 and CX28225)
6	0	Update Enable for Receive group 11	addresses 0x6D8–0x6DB (Not defined for CX28224 and CX28225)
5	0	Update Enable for Receive group 10	addresses 0x6D4–0x6D7 (Not defined for CX28224 and CX28225)
4	0	Update Enable for Receive group 9	addresses 0x6D0–0x6D3 (Not defined for CX28224 and CX28225)
3	0	Update Enable for Transmit group 12	addresses 0x638–0x63F (Not defined for CX28224 and CX28225)
2	0	Update Enable for Transmit group 11	addresses 0x630–0x637 (Not defined for CX28224 and CX28225)
1	0	Update Enable for Transmit group 10	addresses 0x628–0x62F (Not defined for CX28224 and CX28225)
0	0	Update Enable for Transmit group 9	addresses 0x620–0x627 (Not defined for CX28224 and CX28225)

0x71F—IMA_GRP_13TO16_SEM (Group Table Control IV (CX28229 Only))

For the following bits, 1 = the group table is being updated, 0 = the group table is not being updated. The update enable must be set to 1 prior to writing the group table. All elements of the group table must be re-written. After writing to all 8 elements, the update enable is reset to 0. The group tables are described below.

NOTE: This register cannot be read back.

Bit	Default	Name	Description
7	0	Update Enable for Receive group 16	addresses 0x7DC–0x7DF (Not defined for CX28224 and CX28225)
6	0	Update Enable for Receive group 15	addresses 0x7D8–0x7DB (Not defined for CX28224 and CX28225)
5	0	Update Enable for Receive group 14	addresses 0x7D4–0x7D7 (Not defined for CX28224 and CX28225)
4	0	Update Enable for Receive group 13	addresses 0x7D0–0x7D3 (Not defined for CX28224 and CX28225)
3	0	Update Enable for Transmit group 16	addresses 0x738–0x73F (Not defined for CX28224 and CX28225)
2	0	Update Enable for Transmit group 15	addresses 0x730–0x737 (Not defined for CX28224 and CX28225)
1	0	Update Enable for Transmit group 14	addresses 0x728–0x72F (Not defined for CX28224 and CX28225)
0	0	Update Enable for Transmit group 13	addresses 0x720–0x727 (Not defined for CX28224 and CX28225)

IMA_TX_GRP*n*_RX_TEST_PATTERN (Transmit Group Rx Test Pattern)

This register contains the value of the Rx Test Pattern field for the transmitted ICP cells.

Group 1–16 Address

n=1	*n*=2	*n*=3	*n*=4	*n*=5	*n*=6	*n*=7	*n*=8	*n*=9	*n*=10	*n*=11	*n*=12	*n*=13	*n*=14	*n*=15	*n*=16

CX28224	Not Applicable														
CX28225			Not Applicable												
CX28229															

Bit	Default	Name	Description
7-0	0	Transmit Cell Count LSBs	Transmit Group Cell Count: This field contains the least significant bits of a 16-bit count of the number of ATM layer cells transmitted over the Transmit links within the group. A write operation with data = 0x01 to the first address (0x440 for Group #1, 0x442 for Group #2, etc.) transfers the state of all 16 bits of the counter to registers that are accessible to the microprocessor bus and clears the state of the counter, The first address should be read first. The second address (0x441 for Group #1, 0x443 for Group #2, etc.) is read next. A write operation with data = 0x00 to the first address of each group returns back to the raw counters.

IMA_TX_GRP*n*_CELL_COUNT_MSB (Transmit Cell Count MSBs)

This register contains the most significant bits of a 16 bit count of the number of ATM layer cells transmitted over the Transmit links within the group. The register is read only. Status clears upon read.

Group 1–16 Address

n=1	*n*=2	*n*=3	*n*=4	*n*=5	*n*=6	*n*=7	*n*=8	*n*=9	*n*=10	*n*=11	*n*=12	*n*=13	*n*=14	*n*=15	*n*=16

CX28225			Not Applicable												
CX28229															

Bit	Default	Name	Description
7-0	0	Receive Cell Count LSBs	Receive Group Cell Count: This field contains the least significant bits of a 16 bit count of the number of ATM layer cells received over the Receive links within the group. A write operation with data = 0x01 to the first address (0x450 for Group #1, 0x452 for Group #2, etc.) transfers the state of all 16 bits of the counter to registers that are accessible to the microprocessor bus and clears the counter. A read operation should then be performed to read the previous state of the counter. The first address should be read first. The second address (0x451 for Group #1, 0x453 for Group #2, etc.) is read next. A write operation with data = 0x00 to the first address of each group returns back to the raw counters.

IMA_RX_GRP*n*_CELL_COUNT_MSB (Receive Cell Count MSBs)

This register contains the most significant bits of a 16 bit count of the number of ATM layer cells received over the Receive links within the group. The register is read only. Status clears upon read.

Group 1–16 Address

CX28225			Not Applicable												
CX28229															

Bit	Default	Name	Description
7	0	Group Enable	1 = Group is established and a round-robin is created 0 = Group is not established
6	0	SW Timeout Expired	1 = certain LSM transitions (Usable → Active) are allowed 0 = certain LSM transitions (Usable → Active) are blocked
5	0	Resync Group	1 = Enables the link differential delay synchronization process 0 = disables the link differential delay synchronization process

4	—	Drain Buffer	This bit is used by the software driver to reset the differential delay in T1/E1 mode:
			    1 = Allows the differential delay buffer to drain excess cell buffering.
			    0 = Normal delay buffering.

3	—	—	Reserved. Set to 0.
2–0	0x0	Group Size	Sets the number of configured links within group. Range: 0x0–0x7 (1–8 links in group)

IMA_RX_GRP*n*_FIRST_PHY_ADDR (Receive First PHY Address)

This register, in conjunction with the IMA_RX_GRP*n*_CTL and
IMA_RX_GRP*n*_CFG registers, controls the operation of the Receive IMA group.

Group 1–16 Address

n=1	*n*=2	*n*=3	*n*=4	*n*=5	*n*=6	*n*=7	*n*=8	*n*=9	*n*=10	*n*=11	*n*=12	*n*=13	*n*=14	*n*=15	*n*=16

CX28225				Not Applicable											
CX28229															

Bit	Default	Name	Description
7–0	—	Tx Test Pattern	If the Test Link Command is set to Active, the Tx Test Pattern is accessed from the ICP cell of the Transmit Test Link. This register should be read multiple times (debounced) to ensure receipt of a valid test pattern. Range: 0x00–0xFF

7.3 IMA Link Registers

The IMA Link layer contains configuration and status information that is associated with IMA groups or pass-through facilities.

0x41E—IMA_LNK_SEM (Link Table Control Register)

For the following bits, 1 = the link table is being updated, 0 = the link table is not being updated. The update enable must be set to 1 prior to writing the link table. All elements of the link table must be re-written. After writing to all 8 elements, the update enable is reset to 0. The link tables are described below.

NOTE:This register cannot be read back.

Bit	Default	Name	Description
7	0	Update Enable for Receive facilities 24–31	addresses 0x780–0x787, 0x7A8–0x7AF (Not defined for CX28224 and CX28225)
6	0	Update Enable for Receive facilities 16–23	addresses 0x680–0x687, 0x6A8–0x6AF (Not defined for CX28224 and CX28225)
5	0	Update Enable for Receive facilities 8–15	addresses 0x580–0x587, 0x5A8–0x5AF (Not defined for CX28224 and CX28225)
4	0	Update Enable for Receive facilities 0–7	addresses 0x480–0x487, 0x4A8–0x4AF
3	0	Update Enable for Transmit facilities 24–31	addresses 0x760–0x767, 0x770–0x777 (Not defined for CX28224 and CX28225)
2	0	Update Enable for Transmit facilities 16–23	addresses 0x660–0x667, 0x670–0x677 (Not defined for CX28224 and CX28225)
1	0	Update Enable for Transmit facilities 8–15	addresses 0x560–0x567, 0x570–0x577 (Not defined for CX28224 and CX28225)
0	0	Update Enable for Transmit facilities 0–7	addresses 0x460–0x467, 0x470–0x477

IMA_TX_LNK*n*_CTL (Transmit Link Control Register)

This register, in conjunction with IMA_TX_LNK*n*_ID register, configures the IMA link attributes for the Transmit port.

hex address:

n	Address		n	Address
0	0x460		16	0x660
1	0x461		17	0x661
2	0x462		18	0x662

Bit	Default	Name	Description
7–6	—	Rx-Stuff-IMA Counter	This field contains a count of the number of Near-End Receive cell stuffing events. Upon a read of this address, the contents of the counter is transferred to a register that is accessible to the microprocessor bus and the counter is cleared.
5	—	—	Reserved.
4	—	—	Reserved.
3	0	Waiting for SW Timer	1 = a transition of the Receive LSM is waiting for an enable from software 0 = no transition of the LSM is waiting for software
2–0	0	NE Rx LSM State	0 = Not In Group 1 = Unusable—no reason given 2 = Unusable—Fault 3 = Unusable—Mis-connected 4 = Unusable—Blocked 5 = Unusable—Failed 6 = Usable 7 = Active

IMA_RX_LNK*n*_DEFECT (Receive Link Defects Register)

This register provides state and status information for the Receive link. This register is primarily **read-only** except for bit 1 which is read/write.

hex address:

n	Address
0	0x490
1	0x491
2	0x492
3	0x493
4	0x494
5	0x495

30	0x796
31	0x797

Bit	Default	Name	Description
7	—	Δ (LIF Defect)	1 = The LIF defect has changed state since the last time this register was read 0 = the LIF defect has not changed state
6	—	LIF Defect	1 = The LIF defect is currently active 0 = the LIF defect is inactive
5	—	Δ (LODS Defect)	1 = The LODS defect has changed state since the last time this register was read 0 = the LODS defect has not changed state
4	—	LODS Defect	1 = The LODS defect is currently active 0 = the LODS defect is inactive
3	—	Δ (RDI Defect)	1 = The RDI defect has changed state since the last time this register was read 0 = the RDI defect has not changed state
2	—	RDI Defect	1 = The RDI defect is currently active 0 = the RDI defect is inactive
1	—	PHY Defect	1 = A PHY defect is active 0 = all PHY defects are inactive
0	—	Rx_TRL Error	This bit is set high if the transition detector for the Rx_TRL input detects a bad signal. This bit is active high and is reset upon reading this address.

IMA_FE_TX_LNK*n*_CFG (FE Transmit Configuration Register)

This **read-only** register provides Far-End Transmit configuration information for the Receive link.

hex address:

n	Address		n	Address
0	0x498		16	0x698
1	0x499		17	0x699
2	0x49A		18	0x69A

7–5	—	FE Tx LSM State	0 = Not In Group 1 = Unusable—no reason given 2 = Unusable—Fault 3 = Unusable—Mis-connected 4 = Unusable—Blocked 5 = Unusable—Failed 6 = Usable 7 = Active
4–2	—	FE Rx LSM State	0 = Not In Group 1 = Unusable—no reason given 2 = Unusable—Fault 3 = Unusable—Mis-connected 4 = Unusable—Blocked 5 = Unusable—Failed 6 = Usable 7 = Active

Bit	Default	Name	Description (Continued)
1–0	—	FE Rx Defect Indicator	0 = No Defects 1 = Physical link defect 2 = LIF defect 3 = LODS defect

IMA_RX_LNK*n*_ID (Receive Link ID Register)

This register, in conjunction with IMA_RX_LNK*n*_CTL register, configures the IMA link attributes for the Receive port.

hex address:

n	Address		n	Address
0	0x4A8		16	0x6A8
1	0x4A9		17	0x6A9
2	0x4AA		18	0x6AA
3	0x4AB		19	0x6AB
4	0x4AC		20	0x6AC
5	0x4AD		21	0x6AD
6	0x4AE		22	0x6AE

11	0x5AB		27	0x7AB
12	0x5AC		28	0x7AC
13	0x5AD		29	0x7AD
14	0x5AE		30	0x7AE
15	0x5AF		31	0x7AF

Bit	Default	Name	Description
7	—	—	Reserved. Set to 0
6	—	—	Reserved. Set to 0
5	—	—	Reserved. Set to 0
4–0	—	Link ID	This field contains the Receive Link ID assigned to this facility. Range: 0x00–0x1F

IMA_RX_LNK*n*_IV_CNT (IMA Violation Counter Register)

This **read-only** register contains a count of the IV-IMA Anomalies for the Receive link.

hex address:

n	Address		n	Address
0	0x4B0		16	0x6B0
1	0x4B1		17	0x6B1
2	0x4B2		18	0x6B2
3	0x4B3		19	0x6B3
4	0x4B4		20	0x6B4
5	0x4B5		21	0x6B5
6	0x4B6		22	0x6B6
7	0x4B7		23	0x6B7
8	0x5B0		24	0x7B0
9	0x5B1		25	0x7B1
10	0x5B2		26	0x7B2
11	0x5B3		27	0x7B3
12	0x5B4		28	0x7B4
13	0x5B5		29	0x7B5
14	0x5B6		30	0x7B6
15	0x5B7		31	0x7B7

Bit	Default	Name	Description
7–0	—	IV-IMA Counter	This field contains a count of the ICP-ERR, ICP-INV, and ICP-MIS anomalies. Writing a 0x01 to address 0x4B0 will freeze the value of all the IV-IMA and OIF-IMA counters in the defined registers. The internal counters are cleared by this action. After all the registers have been read, writing a 0x00 to address 0x4B0 will release the "freeze" and the defined registers will reflect the current anomaly count.

IMA_RX_LNK*n*_OIF_CNT (Out-of-IMA Frame Counter Register)

This **read-only** register contains a count of the OIF-IMA Anomalies for the Receive link.

hex address:

n	Address		n	Address
0	0x4B8		16	0x6B8
1	0x4B9		17	0x6B9
2	0x4BA		18	0x6BA
3	0x4BB		19	0x6BB
4	0x4BC		20	0x6BC
5	0x4BD		21	0x6BD
6	0x4BE		22	0x6BE
7	0x4BF		23	0x6BF
8	0x5B8		24	0x7B8
9	0x5B9		25	0x7B9
10	0x5BA		26	0x7BA
11	0x5BB		27	0x7BB
12	0x5BC		28	0x7BC
13	0x5BD		29	0x7BD
14	0x5BE		30	0x7BE
15	0x5BF		31	0x7BF

Bit	Default	Name	Description
7	—	—	Reserved.
6	—	—	Reserved.
5	—	—	Reserved.
4	—	—	Reserved.
3–0	—	OIF-IMA Counter	This field contains a count of the OIF anomalies. Writing a 0x01 to address 0x4B0 will freeze the value of all the IV-IMA and OIF-IMA counters in the defined registers. The internal counters are cleared by this action. After all the registers have been read, writing a 0x00 to address 0x4B0 will release the "freeze" and the defined registers will reflect the current anomaly count.

IMA_FE_TX_LNK*n*_GRP_ID (FE Transmit Group ID Register)

This **read-only** register contains the value of the IMA ID field acquired from the received ICP for the Receive link.

hex address:

n	Address		n	Address
0	0x4C0		16	0x6C0
1	0x4C1		17	0x6C1
2	0x4C2		18	0x6C2
3	0x4C3		19	0x6C3
4	0x4C4		20	0x6C4
5	0x4C5		21	0x6C5
6	0x4C6		22	0x6C6
7	0x4C7		23	0x6C7
8	0x5C0		24	0x7C0
9	0x5C1		25	0x7C1
10	0x5C2		26	0x7C2
11	0x5C3		27	0x7C3
12	0x5C4		28	0x7C4
13	0x5C5		29	0x7C5
14	0x5C6		30	0x7C6
15	0x5C7		31	0x7C7

Bit	Default	Name	Description
7–0	—	Actual Rx Group ID	This field contains the value of the Group ID field from the ICP cells for this facility. Range: 0x00–0xFF

8 Electrical and Mechanical Specifications

This chapter describes the electrical and mechanical aspects of the CX2822x. It includes timing diagrams, absolute maximum ratings, DC characteristics, and mechanical drawings.

8.1   Timing Specifications

This section provides timing diagrams and descriptions for the various interfaces of the CX2822x. The timing relationship labels are numbered when they occur more than once in a diagram, so each label is unique. This numbering aids in identifying the appropriate label in the timing table. Signals are measured at the 50% point of the changing edge, except for those involving high impedance transitions, which are measured at 10% and 90%.

Figure 8-1 and Figure 8-2 illustrate how input and output waveforms are defined.

Figure 8-1.   Input Waveform
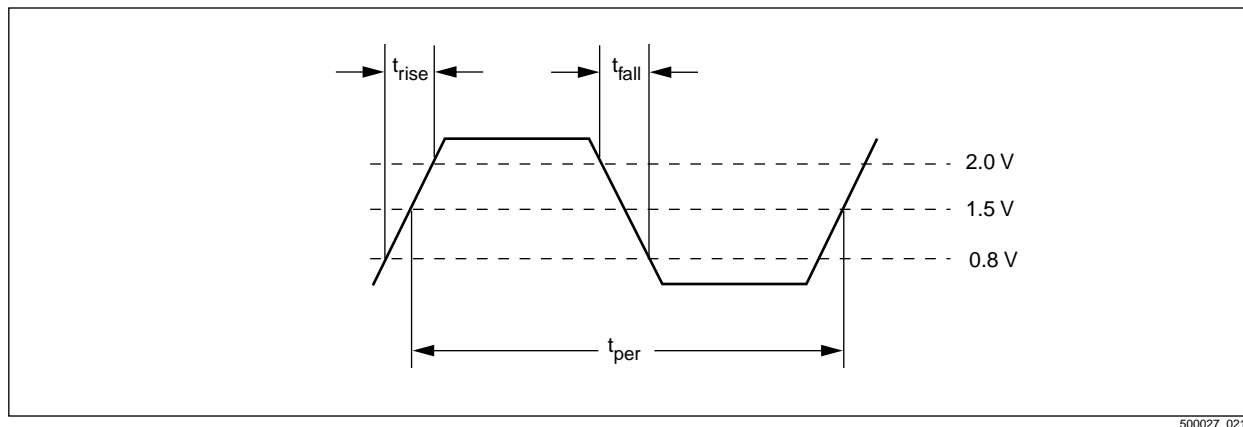

500027_021

Figure 8-2. Output Waveform
500027_022

8.1.1　　Microprocessor Timing

Figures 8-3 through 8-6 and Tables 8-1 through 8-4 show the timing requirements and characteristics of the microprocessor interface. Capacitive load on all signals is 50pF.

*Figure 8-3. Microprocessor Timing Diagram—Asynchronous Read*
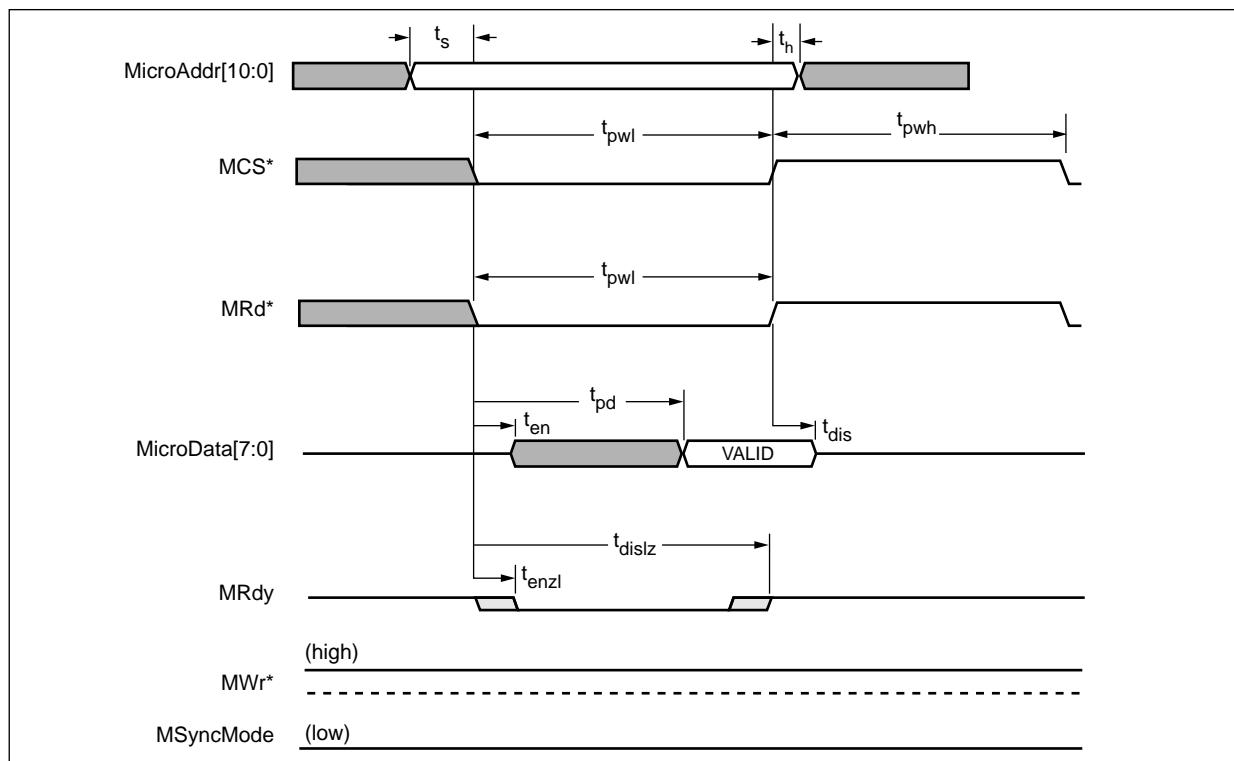

500027_023a

Table 8-1. Microprocessor Timing Table—Asynchronous Read

Label	Description	Min	Max	Unit
MicroClk	Microprocessor Clock	—	50	MHz
t_{pwh}	Pulse Width High	3 * MicroClk + 15	—	ns
t_{pwl}	Pulse Width Low	3 * MicroClk + 15	—	ns
t_s	Setup, MicroAddr[10:0] to the falling edge of (MCS* + MRd*)[1]	2	—	ns
t_h	Hold, MicroAddr[10:0] from the rising edge of (MCS* + MRd*)[2]	7	—	ns
t_{en}	Enable, MicroData[7:0] from the falling edge of (MCS* + MRd*)[1]	2	20	ns
t_{pd}	Propagation Delay, MicroData[7:0] from the falling edge of (MCS* + MRd*)[1]	2 * MicroClk	3 * MicroClk +14	ns
t_{dis}	Disable, MicroData[7:0] from the rising edge of (MCS* + MRd*)[2]	2	20	ns
t_{enzl}	Enable, MRdy from the falling edge of (MCS* + MRd*)[1]	1	20	ns
t_{dislz}	Disable, MRdy from the falling edge of (MCS* + MRd*)[1]	2.5 * MicroClk	3.5 * MicroClk +15	ns

FOOTNOTE:
[1] Timing starts from whichever is asserted last.
[2] Timing relative to whichever goes inactive first.

*Figure 8-4. MIcroprocessor Timing Diagram—Asynchronous Write*

t_{rec}	Recovery, the rising edge of TCK from the rising edge of TRST*	2.5	—	ns
t_{s1}	Setup, TMS to the rising edge of TCK	2	—	ns
t_{h1}	Hold, TMS from the rising edge of TCK	2	—	ns
t_{s2}	Setup, TDI to the rising edge of TCK	2	—	ns
t_{h2}	Hold, TDI from the rising edge of TCK	20	—	ns
t_{en}	Enable, TDO from the falling edge of TCK	0.8	7	ns
t_{pd}	Propagation Delay, TDO from the falling edge of TCK	0.8	7	ns
t_{dis1}	Disable, TDO from the falling edge of TCK	0.8	7	ns
t_{dis2}	Disable, TDO from the falling edge of TRST*	0.8	7	ns
	Inputs with respect to TCK rise	2.0	20.0	ns
	Outputs with respect to TCK rise	0.5	15.0	ns
GENERAL NOTE: All loads equal 80 pF.				

8.1.6　　　One-second Interface Timing

Figure 8-14 and Table 8-12 show the timing requirements and characteristics of the one-second interface.

Figure 8-14. One-second Timing Diagram

General Notes:

When OneSecIO is configured as an output, it is equal to 8kHzIn/8000.

500027_033

Table 8-12. One-second Timing Table

Label	Description	Min	Max	Unit
	8KHzIn Clock Frequency	0.01	100	KHz
t_{per}	8KHzIn Duty Cycle	40%	60%	
t_{pd}	Propagation Delay, OneSecOut from the rising edge of OneSecClk	1	15	ns

8.2   Expansion Memory Port Timing

Figure 8-15. Read/Write Timing
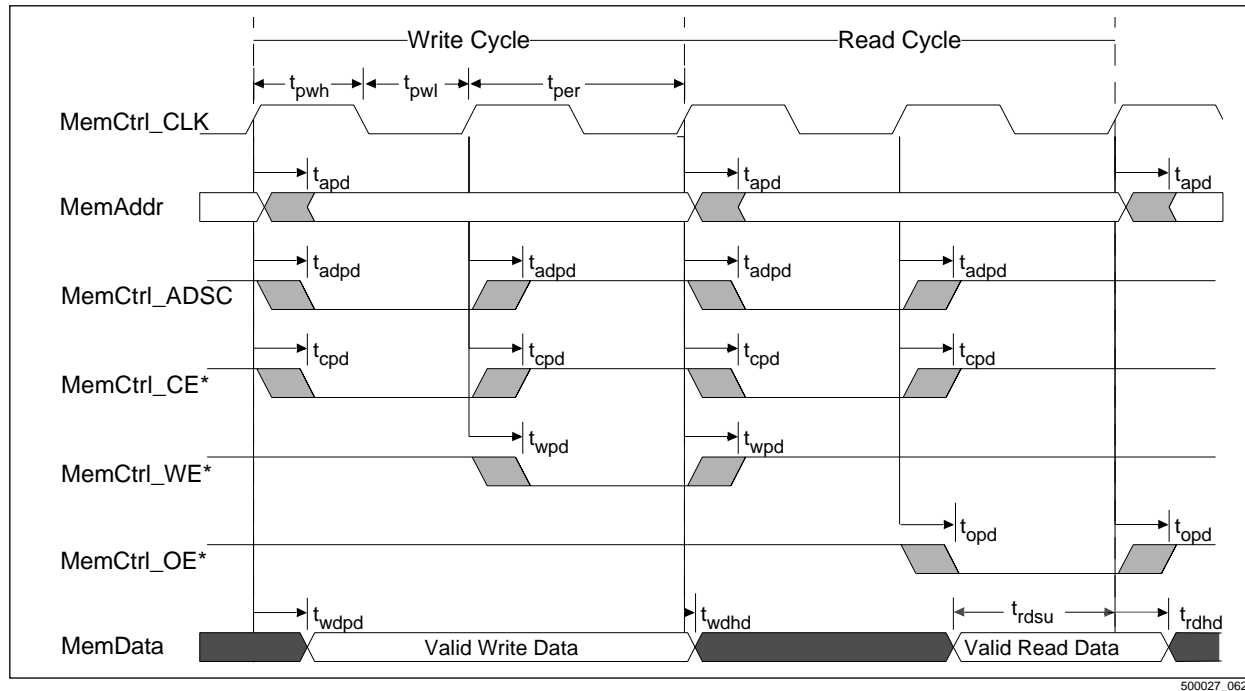

500027_062

Table 8-13. Expansion Memory Port Read/Write Timing Table

Label	Description	Min	Max	Unit
t_{pwl}	Pulse Width Low	8	—	ns
t_{pwh}	Pulse Width High	8	—	ns
t_{per}	Period	20	—	ns
t_{apd}	Propagation Delay, MemAddr from rising edge of MemCtrl_CLK	1.0	10.0	ns
t_{adpd}	Propagation Delay, MemCtrl_ADSC from rising edge of MemCtrl_CLK	1.0	10.0	ns
t_{cpd}	Propagation Delay, MemCtrl_CE* from rising edge of MemCtrl_CLK	1.0	10.0	ns
t_{wpd}	Propagation Delay, MemCtrl_WE* from rising edge of MemCtrl_CLK	1.0	10.0	ns
t_{opd}	Propagation Delay, MemCtrl_OE* from rising edge of MemCtrl_CLK	1.0	10.0	ns
t_{wdpd}	Propagation Delay, valid write data from rising edge of MemCtrl_CLK	—	10.0	ns
t_{wdhd}	Hold, valid write data from rising edge of MemCtrl_CLK	1.0	—	ns
t_{rdsu}	Setup, read data to rising edge of MemCtrl_CLK	5.0	—	ns
t_{rdhd}	Hold, read data from rising edge of MemCtrl_CLK	1.0	—	ns
The timing requirements and characterization were calculated based on 20 pF capacitive loading.				

8.3   Absolute Maximum Ratings

The absolute maximum ratings in Table 8-14 indicate the maximum stresses that the CX2822x can tolerate without risking permanent damage. These ratings are not typical of normal operation of the device. Exposure to absolute maximum rating conditions for extended periods of time may affect the device's reliability. This device should be handled as an ESD-sensitive device. Voltage on any signal pin that exceeds the power supply voltage by more than +0.5 V can induce destructive latchup.

Table 8-14. Absolute Maximum Ratings (General)

Parameter	Value
Supply Voltage	−0.5 to +3.3 V
Input Voltage	−0.5 to Vdd + 0.5 V
Storage Temperature	−40 °C to 125 °C
Operating Temperature Range	−40 °C to 85 °C
Lead Temperature	+240 °C for 10 seconds
Junction Temperature	+150 °C
Maximum Current at Maximum Clock Frequencies	125 mA (1.8 V) 120 mA (3.3 V)
Static Discharge Voltage (Human Body Model)	±2000 V
Latch-up Current	±150 mA
DC Input Current	±20 mA

Table 8-15. Absolute Maximum Ratings (CX28229/CX28225/CX28224)

Parameter	Value
θ_{JC}	4 °C/W
θ_{JA} No Airflow	33 °C/W
θ_{JA} 1.5 m/s Airflow	29 °C/W

8.4 DC Characteristics

Table 8-16 lists the DC characteristics of the CX2822x.

Table 8-16. DC Characteristics

Parameter	Min	Typical	Max	Comments
Power Supply V_{DD} 3.3 V	3.0	3.3	3.6	VDC ±10%
Power Supply V_{DD} 1.8 V	1.71	1.8	1.89	VDC ±5%
Input Low Voltage (VIL)—TTL	0	—	0.8	VDC
Input High Voltage (VIH)—TTL	2.0	—	5.25	VDC
Output Voltage Low (TTL)	—	—	0.4	Volts; I_{OH} = 4.0 mA
Output Voltage High (TTL)	2.4	—	—	Volts; I_{OH} = 1500 µA
Input Leakage Current	–10	—	10	µA; Vin = PWR or GND
Three-state Output Leakage Current	–10	—	10	µA; Vout = PWR or GND
Input Capacitance	—	—	7	pF
Output Capacitance	—	—	7	pF
Bidirectional Capacitance	—	—	7	pF
Power				
V_{DD} 3.3 V	—	250	—	mW
V_{DD} 1.8 V	—	150	—	mW

8.5   Mechanical Drawing

The CX28224/5/9 is a 256-ball BGA package. A mechanical drawing of the device is provided in Figure 8-16 and Figure 8-17.
Figure 8-16. CX28224/5/9 Mechanical Drawing (Bottom View)

A

IMA Version 1.1 PICS Proforma

To evaluate conformance of a particular implementation, it is necessary to have a statement of which capabilities and options have been implemented for a given protocol. Such a statement is called a Protocol Implementation Conformance Statement (PICS).

A.1   Scope

This annex provides the PICS proforma for the Inverse Multiplexing for ATM (IMA) Version 1.1 Specification as described in AF-PHY-0086.001[A-1] in compliance with the relevant requirements, and in accordance with the relevant guidelines, given in ISO/IEC 9646-2[A-3].

A.2   Definitions

This document uses the following terms defined in ISO/IEC 9646-1[A-2]:
- a Protocol Implementation Conformance Statement (PICS) is a statement made by the supplier of an implementation or a system, stating which capabilities have been implemented for a given protocol,
- a PICS Proforma is a document in the form of a questionnaire, designed by the protocol specifier or the conformance test suite specifier, which when completed for an implementation or a system, becomes the PICS, and
- a static conformance review is a review of the extent to which the static conformance requirements are met by the implementation, accomplished by comparing the PICS with the static conformance requirements expressed in the relevant protocol specification.

A.3   Symbols and Conventions

M—Mandatory

O—Option (may be selected to suit the implementation, provided that any requirements applicable to the options are observed)

A.4   Conformance

The supplier of a protocol implementation, which is claimed to conform to AF-PHY-0086.001[A-1], is required to complete a copy of the PICS proforma provided in the following sections of this annex and is required to provide the information necessary to identify both the supplier and the implementation.

A.5   IMA PICS Proforma

A.5.1   Global Statement of Conformance

The implementation described in this PICS Proforma meets all of the mandatory requirements of the protocol specification.

Yes XX

No__

Note: Answering "No" indicates non-conformance to the protocol specification. Non-supported mandatory capabilities are to be identified in the following tables, with an explanation in the "Comments" section of each table as to why the implementation is "non conforming".

A.5.2   Instructions for Completing the PICS Proforma

Each question in this section refers to a major function of the protocol. Answering "Yes" to a particular question states that the implementation supports all of the mandatory procedures for that function, as defined in the referenced section of AF-PHY-0086.001[A-1]. Answering "No" to a particular question in this section states that the implementation does not support that function of the protocol.

A supplier may also provide additional information, categorized as exceptional (X) or supplementary information. This additional information should be provided in the Support column as items labeled X<I> for exceptional or S<I> for supplementary information, respectively for cross-reference purposes, where <I> is any unambiguous number.

A.5.3   IMA Protocol Functions

Table A-1. Basic IMA Protocol (BIP) Definition Functions (1 of 5)

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
BIP.1	Does the implementation support a number N (1 ≤ N ≤ 32) of transmission links within an IMA group operating at the same nominal link cell rate (LCR)?		M	(R-1)	Yes_X_No__ 1 ≤ N ≤ 8
BIP.2	Does the implementation support the IMA interface connected to another interface over clear channel facilities (implies cells generated by transmit IMA shall only be terminated at the receive IMA)?		M	(R-2)	Yes_X_No__
BIP.3	Does the interface specific TC sublayer of the implementation pass all cells to the IMA sublayer or provide an indication that a cell was received (this includes HEC errored cells)?		M	(R-3)	Yes_X_No__
BIP.4	Does the implementation prohibit cell rate decoupling at the interface specific TC sublayer?		M	(R-4)	Yes_X_No__
BIP.5	Does the implementation assign a LID unique within the IMA group to each Tx IMA link on each physical link?		M	(R-5)	Yes_X_No__
BIP.6	Does the implementation ensure that the LID does not change while the link is a member of the IMA group?		M	(R-6)	Yes_X_No__
BIP.7	Does the implementation distribute ATM cells arriving from the ATM layer over the N links in a cyclic round-robin fashion, and on a cell-by-cell basis?		M	(R-7)	Yes_X_No__
BIP.8	Does the implementation distribute ATM cells over the links using an ascending order based on the LID assigned to each link within the IMA group?		M	(R-8)	Yes_X_No__
BIP.9	Does the implementation support the ICP cell format defined in Table 2 on page 31 to convey IMA configuration, synchronization, status, and defect information to the far-end?		M	(R-9)	Yes_X_No__
BIP.10	Does the implementation perform cell rate decoupling by inserting IMA Filler cells in place of ATM cells when there is no cell available at the ATM layer?		M	(R-10)	Yes_X_No__
BIP.11	Does the implementation accept, on receive, ATM cells from the N links according to ascending order based on the LID received in the ICP cells on the incoming link?		M	(R-11)	Yes_X_No__
BIP.12	Does the implementation, on receive, compensate for link differential delays and rebuild the original ATM cell stream?		M	(R-11)	Yes_X_No__
BIP.13	Does the implementation discard received Filler cells and cells with bad HEC?		M	(R-11)	Yes_X_No__
BIP.14	Does the implementation process and discard incoming ICP cells?		M	(R-11)	Yes_X_No__
BIP.15	Does the implementation aggregate, on receive, the ATM cell stream to the ATM layer?		M	(R-11)	Yes_X_No__
BIP.16	Does the implementation preserve the order of incoming cells?		M	(R-11)	Yes_X_No__
BIP.17	Does the implementation use the ICP cell to maintain IMA protocol synchronization?		M	(R-12)	Yes_X_No__

Table A-1. Basic IMA Protocol (BIP) Definition Functions (2 of 5)

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
BIP.18	Does the implementation use the ICP cell to maintain link delay synchronization?		M	(R-12)	Yes_X_No__
BIP.19	Does the implementation transmit first the most significant bit of each octet of the IMA OAM cell?		M	(R-13)	Yes_X_No__
BIP.20	Does the implementation support the same cell header for both the Filler and ICP cell formats as defined in Table 1 on page 28 and Table 2 on page 31?		M	(R-14)	Yes_X_No__
BIP.21	Does the implementation use bit 7 of octet 7 (CID field) of the Filler and ICP cells to identify the IMA OAM cell as an ICP or Filler cell?		M	(R-15)	Yes_X_No__
BIP.22	Does the implementation use octets 52-53 as specified in ITU-T Recommendation I.610 [A-5] for octets 52-53 of the OAM cells of the F1/F3 flows?		M	(R-16)	Yes_X_No__
BIP.23	Does the implementation support the Filler cell format defined in Table 1 on page 28?		M	(R-17)	Yes_X_No__
BIP.24	Does the implementation support the ICP cell format defined in Table 2 on page 31?		M	(R-18)	Yes_X_No__
BIP.25	Does the implementation transmit the content of the link specific fields appearing in class A over the link for which these fields apply?		M	(R-19)	Yes_X_No__
BIP.26	Does the implementation transmit the same content of fields appearing in classes B and C of the ICP cell over all links within an IMA group?		M	(R-20)	Yes_X_No__
BIP.27	Does the implementation use the LID bits (bits 4-0 of octet 7) in the ICP cell to identify the Link ID (range being 0 to 31)?		M	(R-21)	Yes_X_No__
BIP.28	Does the implementation use the "Tx State" field, located in the Link "x" Information field in an ICP cell, to report the transmit state of the IMA link on which the NE IMA is transmitting ICP cells carrying LID = "x" ("x" being a value between 0 and 31)?		M	(R-22)	Yes_X_No__
BIP.29	Does the implementation use the "Rx State", located in the Link "x" Information field in an ICP cell, to report the receive state of the incoming IMA link on which the FE IMA is transmitting ICP cells carrying LID = "x" ("x" being a value between 0 and 31)?		M	(R-23)	Yes_X_No__
BIP.30	Does the implementation use the "Rx Defect Indicators" field, located in the Link "x" Information field in an ICP cell, to report the Rx defect indicators corresponding to the incoming IMA link on which the FE IMA is transmitting ICP cells carrying LID = "x" ("x" being a value between 0 and 31)?		M	(R-24)	Yes_X_No__
BIP.31	Does the implementation always transmit ICP cells with Octet 50 unused and set to "0x6A" as defined in ITU-T Recommendation I.432 [A-4]?		M	(R-25)	Yes_X_No__
BIP.32	Does the implementation reserve the End-to-End Channel field (Octet 51) as a proprietary channel?		M	(R-26)	Yes_X_No__
BIP.33	Does the implementation set the End-to-End Channel field (Octet 51) to "0" when not using this field?		M	(R-27)	Yes_X_No__

Table A-1. Basic IMA Protocol (BIP) Definition Functions (3 of 5)

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
BIP.34	Does the implementation not rely on the processing of the End-to-End Channel field for any IMA functionality?		M	(R-28)	Yes_X_No__
BIP.35	Does the implementation only consider the information within ICP cells exhibiting neither a HEC nor a CRC-10 error?		M	(R-29)	Yes_X_No__
BIP.36	Does the implementation always transmit "0x03" over the OAM Label in the Filler and ICP cells?		M	(R-30)	Yes_X_No__
BIP.37	If the implementation does not support the IMA version proposed by the OAM Label received from the far-end IMA unit, does the implementation report the "Config-Aborted - Unsupported IMA Version" state over the "Group Status and Control" field?		M	(R-31)	Yes_X_No__
BIP.38	Does the implementation transmit IMA frames, composed of M consecutive cells, on each link within the IMA group?		M	(R-32)	Yes_X_No__
BIP.39	Does the implementation send ICP cells on each link once per IMA frame, hence every M cells?		M	(R-33)	Yes_X_No__
BIP.40	Does the implementation use the IFSN field in the ICP cell to indicate the sequence number of the IMA frame?		M	(R-34)	Yes_X_No__
BIP.41	Does the implementation increment the IFSN field in the ICP cell from 0 to 255 and repeat the sequence?		M	(R-35)	Yes_X_No__
BIP.42	Does the implementation increment the IFSN field in the ICP cell with each IMA frame on a per-link basis?		M	(R-36)	Yes_X_No__
BIP.43	Within an IMA frame, does the implementation place identical IFSN values in the ICP cells sent on each link?		M	(R-36)	Yes_X_No__
BIP.44	Does the implementation align the transmission of the IMA frame on all links within an IMA group?		M	(R-37)	Yes_X_No__
BIP.45	Does the implementation use the ICP Cell Offset field (octet 9) to indicate the location of the ICP cell within the IMA frame of length M cells?		M	(R-38)	Yes_X_No__
BIP.46	Does the implementation always set the value of the ICP cell offset between 0 and M-1 where M is the IMA frame length in cells?		M	(R-39)	Yes_X_No__
BIP.47	Does the implementation distribute the ICP cells, from link to link within the IMA group, in an uniform fashion across the IMA frame?		O	(O-1)	Yes_X_No__
BIP.48	Does the implementation select the offset of the ICP cell sent of any link when the link is assigned a LID?		M	(R-40)	Yes_X_No__
BIP.49	Does the implementation retain the offset of the ICP cell sent on a given link until the link is no longer part of the group?		M	(R-40)	Yes_X_No__
BIP.50	Does the implementation always use the Frame Length field in the ICP cell to indicate the value of M?		M	(R-41)	Yes_X_No__
BIP.51	Does the implementation support M = 128?		M	(R-42)	Yes_X_No__
BIP.52	Does the implementation support M = 32?		O	(O-2)	Yes_X_No__
BIP.53	Does the implementation support M = 64?		O	(O-2)	Yes_X_No__
BIP.54	Does the implementation support M = 256?		O	(O-2)	Yes_X_No__

Table A-1. Basic IMA Protocol (BIP) Definition Functions *(4 of 5)*

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
BIP.55	Does the implementation only change the value M at group start-up time?		M	(R-43)	Yes_X_No__
BIP.56	Does the implementation use on transmit the value configured by the UM?	(O-2)	M	(CR-1)	Yes_X_No__
BIP.57	Does the implementation allow different values of M in both Tx and Rx directions?	(O-2)	M	(CR-2)	Yes_X_No__
BIP.58	Does the implementation synchronize its incoming links using the received M value for IMA frame synchronization?	(O-2)	M	(CR-3)	Yes_X_No__
BIP.59	Does the implementation abort the start-up procedure using the corresponding code in the Group Status and Control field of the ICP cell when it does not support the received M?		M	(R-44)	Yes_X_No__
BIP.60	Does the implementation allow to configure the value M?		O	(O-3)	Yes_X_No__
BIP.61	Does the implementation set the SCCI field to the previously transmitted SCCI field value, incremented modulo 256, to indicate a change on at least one of the fields appearing in octets 12 through 49 in the transmitted ICP cell?		M	(R-45)	Yes_X_No__
BIP.62	Does the implementation use the SCCI field to identify received ICP cells for processing when ICP cells are monitored on more than one link, or when the monitored link has changed?		M	(R-46)	Yes_X_No__
BIP.63	Does the implementation process the fields in octets 12 through 49 if the SCCI field has advanced beyond the SCCI value of the last processed ICP cell?		M	(R-46)	Yes_X_No__
BIP.64	Does the implementation select the IMA ID at group start-up time?		M	(R-47)	Yes_X_No__
BIP.65	Does the implementation transmit the IMA ID in the IMA ID field?		M	(R-48)	Yes_X_No__
BIP.66	Does the implementation allow to configure the value of IMA ID?		O	(O-4)	Yes_X_No__
BIP.67	Does the implementation use the "Group Symmetry Mode" field, specified in Table 2 on page 31, to indicate the symmetry of the IMA group?		M	(R-49)	Yes_X_No__
BIP.68	Does the implementation ensure that the symmetry of the group is only established or changed at group start-up time?		M	(R-50)	Yes_X_No__
BIP.69	Does the implementation support the Symmetrical Configuration and Operation mode?		M	(R-51)	Yes_X_No__
BIP.70	Does the implementation support the Symmetrical Configuration and Asymmetrical Operation mode?		O	(O-5)	Yes_X_No__
BIP.71	Does the implementation support the Asymmetrical Configuration and Operation mode?		O	(O-6)	Yes_X_No__
BIP.72	Does the implementation abort the start-up procedure using the appropriate code defined in the "Group Status and Control" field of the ICP cell (as specified in Table 2 on page 31) if the NE does not support the symmetry mode proposed by the FE?		M	(R-52)	Yes_X_No__

Mindspeed Technologies™

Table A-1. Basic IMA Protocol (BIP) Definition Functions (5 of 5)

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
BIP.73	Does the implementation abort the start-up procedure using the appropriate code defined in the "Group Status and Control" field of the ICP cell (as specified in Table 2 on page 31) if the symmetry mode proposed by the FE and the configured symmetry mode of the NE do not match?		M	(R-52)	Yes_X_No__
BIP.74	In order to allow a fast recovery when (O-5) or (O-6) is used at the NE and when the FE IMA unit can only be configured to the "Symmetrical Configuration and Operation" mode, does the implementation adjust to "Symmetrical Configuration and Operation".		O	(O-7)	Yes_X_No__
BIP.75	Does the implementation support only the valid combinations of group symmetry modes at each end of the IMA virtual link as specified in Table 4 on page 36?		M	(R-53)	Yes_X_No__
BIP.76	Does the implementation allow configuration of the group mode?		O	(O-8)	Yes_X_No__
Comments: Maximum group size is 8 links.					

Table A-2. QoS Requirements Functions

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
QOS.1	Does the implementation support all ATM traffic/QoS classes supported by the ATM layer?		M	(R-54)	Yes_X_No__
Comments:					

Table A-3. CTC and ITC Operation Functions (1 of 2)

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
CIT.1	Does the implementation indicate to the FE in which transmit clock mode it is running in the "Transmit Clock Mode" field in the ICP cell?		M	(R-55)	Yes_X_No__
CIT.2	Does the implementation support the CTC mode in the transmit direction?		M	(R-56)	Yes_X_No__
CIT.3	Does the implementation only indicate to the FE that it is in the CTC mode when all the "transmit" clocks of the links in the group are derived from the same source?		M	(R-57)	Yes_X_No__
CIT.4	Does the implementation support the ITC mode in the transmit direction?		O	(O-9)	Yes_X_No__
CIT.5	Does the implementation indicate that it is in the ITC mode even if all the transmit clocks of the links in the group are derived from the same source?		O	(O-10)	Yes_X_No__
CIT.6	Does the implementation use the cell stuffing procedure to prevent link transmit buffer under-run or over-run?	(O-9)	M	(CR-4)	Yes_X_No__

Table A-3. CTC and ITC Operation Functions *(2 of 2)*

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
CIT.7	Does the implementation indicate a stuff event in the ICP cell preceding a stuff event using the mandatory LSI codes specified in Table 2 on page 30?		M	(R-58)	Yes_X_No__
CIT.8	Does the implementation perform stuffing by repeating the ICP cell containing the LSI code indicating that "this cell is 1 out of 2 ICP cells comprising the stuff event"?		M	(R-59)	Yes_X_No__
CIT.9	Does the implementation also indicate an incoming stuff event in the fourth, third, and second ICP preceding the stuff event using the optional LSI codes?		O	(O-11)	Yes_X_No__
CIT.10	At any given link, does the implementation ensure it does not introduce a stuff event more than once every 5*M ICP, Filler and ATM layer cells?		M	(R-60)	Yes_X_No__
CIT.11	Does the implementation remove one of any two consecutive ICP cells with LSI code indicating "this cell is 1 out of the 2 ICP cells comprising the stuff event"?		M	(R-61)	Yes_X_No__
CIT.12	Does the implementation ensure that the SICP cell is not counted as a cell for the purposes of determining the IMA round-robin sequence?		M	(R-61)	Yes_X_No__
CIT.13	Does the implementation support CTC and ITC modes on receive?		M	(R-62)	Yes_X_No__
CIT.14	Does the implementation inform the UM of a mismatch between the FE and NE IMA transmit clock modes?		M	(R-63)	Yes_X_No__
CIT.15	Does the implementation ensure that a restart is not caused if the implementation detects a mismatch between the FE and NE Transmit clock modes?		M	(R-63)	Yes_X_No__
CIT.16	Does the implementation rely on at least one ICP cell with a correct CRC-10 in order to process the incoming stuff cell indication code (this is recommended)?		O	(O-12)	Yes_X_No__
Comments:					

Table A-4. IMA Data Cell (IDC) Rate Implementation Functions

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
IDC.1	Does the implementation ensure on transmit that a Filler cell is not injected if an ATM layer cell is available for scheduling?		M	(R-64)	Yes_X_No__
IDC.2	Does the implementation only check on transmit that an ATM layer cell is available and accept that cell only when the Tx IDCC ticks?		M	(R-64)	Yes_X_No__
IDC.3	Does the implementation only select the TRL from the set of links whose transmit state is Active?		M	(R-65)	Yes_X_No__
IDC.4	If there is no link in the Active state, does the implementation select one of the links in the Usable state, if any, or one of the links in the Unusable state otherwise?		M	(R-66)	Yes_X_No__
IDC.5	Does the implementation only select or change the TRL during the following situations: during group start-up, when the previously selected TRL's transmit state changes from Active to any other state (e.g., Usable, Unusable, or Not In Group) while another link's transmit state is Active, or when the previously selected TRL's transmit state changes from Usable to Unusable or Not In Group while another link's transmit state is Active or Usable?		M	(R-67)	Yes_X_No__
IDC.6	Does the implementation indicate the selected or changed TRL to the FE over the "Transmit Timing Information" field in the ICP cell?		M	(R-68)	Yes_X_No__
IDC.7	Does the implementation derive the Tx IDCC from the selected TRL according to Equation 1 on page 40?		M	(R-69)	Yes_X_No__
IDC.8	When running in the CTC mode, does the implementation introduce a stuff event every 2048 ICP, Filler and ATM layer cells on all links?		M	(R-70)	Yes_X_No__
IDC.9	Does the implementation introduce a stuff event every 2048 ICP, Filler and ATM layer cells on the TRL?	(O-9)	M	(CR-5)	Yes_X_No__
IDC.10	Does the implementation introduce stuff events on links other than the TRL in order to compensate for the timing difference between the TRL and the other links?	(O-9)	M	(CR-6)	Yes_X_No__
IDC.11	Does the implementation remove CDV attributed to the presence of ICP cells by a mechanism equivalent to providing a small smoothing buffer into which cells are placed after reordering and after removing ICP cells?		M	(R-71)	Yes_X_No__
IDC.12	If the TRL is in the Working state and the FE has, for at least 100 milliseconds, identified a given link as the TRL, does the implementation derive the Rx IDCR using the incoming link indicated by the FE as the TRL?		M	(R-72)	Yes_X_No__
IDC.13	Does the implementation have an equivalent behavior to the following: when the IMA data cell clock at the receiver ticks, one cell is removed from the smoothing buffer; if the cell is a Filler cell, then the Filler cell is discarded and nothing passed to the ATM layer; if the cell is not a Filler cell, then it is passed to the ATM layer?		M	(R-73)	Yes_X_No__
Comments:					

Table A-5. Link Differential Delay (LDD) Functions

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
LDD.1	Does the implementation introduce a differential delay among the constituent links of a maximum of 2.5 cell times at the physical link rate?		M	(R-74)	Yes_X_No__
LDD.2	Does the implementation tolerate up to at least 25 milliseconds of link differential delay on receive?		M	(R-75)	Yes_X_No__
LDD.3	Does the implementation allow configuring the link differential delay tolerance?		O	(O-13)	Yes_X_No__
Comments:					

Table A-6. IMA Interface Operation (IIO) Functions (1 of 4)

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
IIO.1	Does the implementation support the Tx LSM defined in Table 8 on page 52?		M	(R-76)	Yes_X_No__
IIO.2	Does the implementation support the Rx LSM defined in Table 9 on page 53?		M	(R-77)	Yes_X_No__
IIO.3	Does the implementation signal the current state of the Tx LSM to the FE IMA unit via the ICP cells?		M	(R-78)	Yes_X_No__
IIO.4	Does the implementation perform the actions corresponding to the Tx LSM sub-states?		M	(R-78)	Yes_X_No__
IIO.5	Does the implementation update the Tx LSM according the occurrence of the events listed in Table 8 on page 52?		M	(R-78)	Yes_X_No__
IIO.6	Does the implementation treat sequentially the incoming events that trigger the Tx LSM, although the order of treatment is implementation specific if these events appear simultaneously?		M	(R-78)	Yes_X_No__
IIO.7	Does the implementation signal the current state of the Rx LSM to the FE IMA unit via the ICP cells?		M	(R-78)	Yes_X_No__
IIO.8	Does the implementation perform the actions corresponding to the Rx LSM sub-states?		M	(R-78)	Yes_X_No__
IIO.9	Does the implementation update the Rx LSM according the occurrence of the events listed in Table 9 on page 53?		M	(R-78)	Yes_X_No__
IIO.10	Does the implementation treat sequentially the incoming events that trigger the Rx LSM, although the order of treatment is implementation specific if these events appear simultaneously?		M	(R-78)	Yes_X_No__
IIO.11	Does the implementation report any change of the Tx and Rx LSMs within the next 2*M (where M is the M used by the IMA transmitter) cells on that link over the "Tx State" and "Rx State" fields of the Link Information field (refer to Table 3 on page 32)?		M	(R-79)	Yes_X_No__
IIO.12	Does the implementation use one of the Unusable encodings when reporting the Unusable state?		M	(R-80)	Yes_X_No__

Table A-6. IMA Interface Operation (IIO) Functions (2 of 4)

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
IIO.13	Does the implementation use "Inhibited", "Failed", "Fault" or "Mis-connected" as a reason when reporting the Unusable state?		O	(O-14)	Yes _X_ No _X_ Partial Usage
IIO.14	Does the implementation re-evaluate the TX and Rx LSMs state upon each incoming ICP cell with new state indication?		M	(R-81)	Yes _X_ No__
IIO.15	Does the implementation allow the valid combinations of Tx and Rx LSM states and disallow the invalid combinations when running in the Symmetrical Configuration and Operation mode?		M	(R-82)	Yes _X_ No__
IIO.16	Does the implementation allow the valid combinations of Tx and Rx LSM states and disallow the invalid combinations when running in the Symmetrical Configuration and Asymmetrical Operation mode?		M	(R-82)	Yes _X_ No__
IIO.17	Does the implementation allow all combinations of Tx and Rx LSM states when running in the Asymmetrical Configuration and Operation mode?		M	(R-82)	Yes _X_ No__
IIO.18	Does the implementation report any GSM states, with the exception of the Not Configured state, to the FE group using the corresponding value defined in the "Group Status and Control" field?		M	(R-83)	Yes _X_ No__
IIO.19	Does the implementation always send over each link the same value in the "Group Status and Control" field for at least 2 consecutive IMA frames?		M	(R-84)	Yes _X_ No__
IIO.20	Does the implementation validate the Rx OAM Label, Rx M, and Rx IMA ID over at least one link before moving into the Start-up-Ack state?		M	(R-85)	Yes _X_ No__
IIO.21	Does the implementation use the validated Rx OAM Label, Rx M, and Rx IMA ID to achieve IMA frame synchronization as defined in Section 11 on page 68?		M	(R-86)	Yes _X_ No__
IIO.22	Does the implementation ensure that at least P_{Tx} links in the transmit direction and P_{Rx} links in the received direction can be moved into the Active state before moving the GSM into the Operational state?		M	(R-87)	Yes _X_ No__
IIO.23	Does the implementation ensure that P_{Tx} is greater than zero?		M	(R-88)	Yes _X_ No__
IIO.24	Does the implementation ensure that P_{Rx} is greater than zero?		M	(R-88)	Yes _X_ No__
IIO.25	Does the implementation ensure that P_{Tx} and P_{Rx} are equal when the configured in the Symmetrical Configuration and Operation mode?		M	(R-89)	Yes _X_ No__
IIO.26	Does the implementation allow configuration of the value of P_{Tx}?		O	(O-15)	Yes _X_ No__
IIO.27	Does the implementation allow configuration of the value of P_{Rx}?		O	(O-15)	Yes _X_ No__
IIO.28	Does the implementation report the Config-Aborted state for at least one second when the configuration requested by the FE is unacceptable?		M	(R-90)	Yes _X_ No__
IIO.29	Does the implementation support the GSM state transitions as defined in 13 on page 60?		M	(R-91)	Yes _X_ No__

Table A-6. IMA Interface Operation (IIO) Functions *(3 of 4)*

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
IIO.30	Does the implementation determine and report that the group is up when both the local and remote GSMs are Operational?		M	(R-92)	Yes_X_No__
IIO.31	Does the implementation determine and report that the group is down when either the local or the remote GSM is not operational?		M	(R-92)	Yes_X_No__
IIO.32	Does the implementation report the proper reasons why the GSM is not operational?		M	(R-92)	Yes_X_No__
IIO.33	Does the implementation report the highest priority reason according to Table 14 on page 61?		M	(R-92)	Yes_X_No__
IIO.34	Does the implementation report the entrance of the GTSM into the Down state to the UM and ATM Layer Management?		M	(R-93)	Yes_X_No__
IIO.35	Is the report of the entrance of the GTSM into the Down state the only notification to the ATM Layer Management about Physical Layer defects or failures?		M	(R-93)	Yes_X_No__
IIO.36	Does the implementation report the return of the GTSM to the Up state to the UM and ATM Layer Management?		M	(R-94)	Yes_X_No__
IIO.37	Does the implementation ensure it does not drop any ATM layer cells when adding or recovering links while the GSM is maintained in the Operational state?		M	(R-95)	Yes_X_No__
IIO.38	Does the implementation ensure that it does not drop any ATM layer cells when deleting or inhibiting links while the GSM is maintained in the Operational state?		M	(R-96)	Yes_X_No__
IIO.39	When running the group start-up procedure, does the implementation ensure that all accepted links have their states changed to Tx=Usable in the same update of the ICP cell?		M	(R-97)	Yes_X_No__
IIO.40	When running the group start-up procedure and after the Tx state of all accepted links has been reported in a previous update of the ICP cell, does the implementation ensure that all accepted links have their states changed to Rx=Active in the same update of the ICP cell?		M	(R-98)	Yes_X_No__
IIO.41	When running the group start-up procedure and after the Rx state of all accepted links has been reported in a previous update of the ICP cell, does the implementation ensure that all accepted links have their states changed to Tx=Active in the same update of the ICP cell?		M	(R-99)	Yes_X_No__
IIO.42	When running the group start-up procedure, does the implementation wait a minimum of one second, unless all the configured links are being reported Tx=Usable by FE, before reporting links Rx=Active?		M	(R-100)	Yes_X_No__
IIO.43	When running the group start-up procedure, does the implementation wait a minimum of one second, unless all the configured links are being reported Rx=Active by FE, before reporting links Tx=Active?		M	(R-101)	Yes_X_No__
IIO.44	Does the implementation synchronize the insertion of new links or recovered links added using the slow recovery mechanism, defined in Section 12.1.3.1 on page 74, within the IMA RR?		M	(R-102)	Yes_X_No__

Table A-6. IMA Interface Operation (IIO) Functions (4 of 4)

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
IIO.45	Does the implementation execute only one LASR procedure per IMA group at any time (even if more than one link is inserted at the same time)?		M	(R-103)	Yes_X_No__
IIO.46	Does the implementation delay the insertion of one or more new links or a possible slow link recovery when the LASR is in progress until the link addition procedure is completed or aborted?		M	(R-104)	Yes_X_No__
IIO.47	When running the LASR procedure, does the implementation ensure that all the inserted links have their states changed to Tx=Usable in the same update of the ICP?		M	(R-105)	Yes_X_No__
IIO.48	When running the LASR procedure and after the Tx state of all accepted links has been reported Usable in a previous update of the ICP cell, does the implementation ensure that all the inserted links have their states changed to Rx=Active in the same update of the ICP cell?		M	(R-106)	Yes_X_No__
IIO.49	When running the LASR procedure and after the Rx state of all accepted links has been reported Active in a previous update of the ICP cell, does the implementation ensure that all the inserted links have their states changed to Tx=Active in the same update of the ICP cell?		M	(R-107)	Yes_X_No__
IIO.50	When running the LASR procedure, does the implementation wait a minimum of one second, unless all the inserted links are being reported Tx=Usable by FE, before reporting links Rx=Active?		M	(R-108)	Yes_X_No__
IIO.51	When running the LASR procedure, does the implementation wait a minimum of one second, unless the inserted links are being reported Rx=Active by FE, before reporting links Tx=Active?		M	(R-109)	Yes_X_No__
Comments: All FE Tx and Rx Unusable Sub-states supported. NE Rx Unusable sub-states supported: No reason, Failed, Inhibited. NE Tx Unusable sub-states supported: No reason.					

Table A-7. IMA Frame Synchronization (IFS) Mechanism Functions

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
IFS.1	Does the implementation perform IMA frame synchronization on each link, based on the IFSM defined in Figure 19 on page 69 and Table 16 on page 69?		M	(R-110)	Yes_X_No__
IFS.2	Does the implementation operate the IFSM for each link independently of any link defects and link delay compensation?		M	(R-111)	Yes_X_No__
IFS.3	Does the implementation support the default value 2 for Alpha(α)?		M	(R-112)	Yes_X_No__
IFS.4	Does the implementation support the default value 2 for Beta(β)?		M	(R-112)	Yes_X_No__
IFS.5	Does the implementation support the default value 1 for Gamma(γ)?		M	(R-112)	Yes_X_No__
IFS.6	Does the implementation support the value 1 for Alpha(α)?		O	(O-16)	Yes_X_No__
IFS.7	Does the implementation support the value 1 for Beta(β)?		O	(O-16)	Yes_X_No__
IFS.8	Does the implementation support the value 3 for Beta(β)?		O	(O-16)	Yes_X_No__
IFS.9	Does the implementation support the value 4 for Beta(β)?		O	(O-16)	Yes_X_No__
IFS.10	Does the implementation support the value 5 for Beta(β)?		O	(O-16)	Yes_X_No__
IFS.11	Does the implementation support the value 2 for Gamma(γ)?		O	(O-16)	Yes_X_No__
IFS.12	Does the implementation support the value 3 for Gamma(γ)?		O	(O-16)	Yes_X_No__
IFS.13	Does the implementation support the value 4 for Gamma(γ)?		O	(O-16)	Yes_X_No__
IFS.14	Does the implementation support the value 5 for Gamma(γ)?		O	(O-16)	Yes_X_No__
IFS.15	Does the implementation assume that any occurrence of HEC/CRC errored cell in the ICP cell position was an ICP cell?		M	(R-113)	Yes_X_No__
IFS.16	Does the implementation ignore the cell content of a HEC/CRC errored cell in the ICP cell position?		M	(R-113)	Yes_X_No__
IFS.17	Does the implementation go into the Hunt state from any other state when no longer getting cells from the physical layer?		O	(O-17)	Yes_X_No__
IFS.18	Does the implementation maintain IMA frame synchronization for cases 1, 2, 3, and 6 identified in Figure 20 on page 71?		M	(R-114)	Yes_X_No__
IFS.19	Does the implementation maintain IMA frame synchronization for case 4 identified in Figure 20 on page 71?		O	(O-18)	Yes_X_No__ Need (O-11)
IFS.20	Does the implementation maintain IMA frame synchronization for case 5 identified in Figure 20 on page 71?		O	(O-18)	Yes_X_No__
IFS.21	Does the implementation maintain IMA frame synchronization for case 7 identified in Figure 20 on page 71 when passing stuff indication over more than one of the previous ICP cells and when Beta(β) is greater than 2?		O	(O-19)	Yes_X_No__ Need (O-11)
Comments: (O-11) required to support (O-18) and (O-19).					

Table A-8. IMA Interface OAM Operation Functions *(1 of 5)*

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
OAM.1	Does the implementation report the following link remote defect indicators: link defects, LIF, and LODS?		M	(R-115)	Yes_X_No__
OAM.2	If several defects are detected at the same time, does the implementation report the defect with the highest priority, as listed in Table 17 on page 72?		M	(R-116)	Yes_X_No__
OAM.3	Does the implementation report any Rx defect to the far-end IMA within the next 2*M cells to be transmitted after the defect state has been entered as specified in Section 12.1.3 on page 72 (where M is the M used by the IMA transmitter)?		M	(R-117)	Yes_X_No__
OAM.4	Does the implementation perform error handling as specified in Figure 21 on page 73 and Figure 22 on page 74?		M	(R-118)	Yes_X_No__
OAM.5	On a given link, does the implementation pass to the ATM layer from the IMA sublayer any cells accumulated before the occurrence of an OCD or OIF anomaly on that link?		M	(R-119)	Yes_X_No__
OAM.6	Does the implementation inhibit the passing from the IMA sublayer to the ATM layer of any cells received on a link during an OCD or OIF anomaly condition reported on that link?		M	(R-120)	Yes_X_No__
OAM.7	Does the implementation replace with Filler cells all ATM layer cells received on a link after an OCD or OIF anomaly condition has been detected on that link?		M	(R-121)	Yes_X_No__
OAM.8	Does the implementation only report an Rx defect in the backward direction after LIF or LODS defect state is entered?		M	(R-122)	Yes_X_No__
OAM.9	Does the implementation report the LIF or LODS defect as specified in Section 12.1.2 on page 72?		M	(R-123)	Yes_X_No__
OAM.10	Does the implementation detect errored ICP cells as indicated in Table 18 on page 77?		M	(R-124)	Yes_X_No__
OAM.11	Does the implementation detect invalid ICP cells as indicated in Table 18 on page 77?		M	(R-124)	Yes_X_No__
OAM.12	Does the implementation detect missing ICP cells as indicated in Table 18 on page 77?		M	(R-124)	Yes_X_No__
OAM.13	Does the implementation report OIF events as indicated in Table 18 on page 77?		M	(R-124)	Yes_X_No__
OAM.14	Does the implementation report LIF defects as indicated in Table 18 on page 77?		M	(R-124)	Yes_X_No__
OAM.15	Does the implementation report LODS defects as indicated in Table 18 on page 77?		M	(R-124)	Yes_X_No__
OAM.16	Does the implementation report RDI-IMA defects as indicated in Table 18 on page 77?		M	(R-124)	Yes_X_No__
OAM.17	Does the implementation increment IV-IMA for every detected errored, invalid or missing ICP cell, except during seconds when a SES-IMA or UAS-IMA condition is reported, as indicated in Table 19 on page 77?		M	(R-125)	Yes_X_No__

Table A-8. IMA Interface OAM Operation Functions *(2 of 5)*

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
OAM.18	Does the implementation increment OIF-IMA for each reported OIF anomaly, except during seconds when a SES-IMA or UAS-IMA condition is reported, as indicated in Table 19 on page 77?		O	(O-20)	Yes_X_No__
OAM.19	Does the implementation increment SES-IMA for every one second interval containing ≥ 30 % of the ICP cells counted as IV-IMA, as indicated in Table 19 on page 77?		M	(R-126)	Yes_X_No__
OAM.20	Does the implementation increment SES-IMA for every one interval of one second containing one or more link defects (e.g., LOS, OOF/LOF, AIS, and LCD), except during seconds when an UAS-IMA condition is reported, as indicated in Table 19 on page 77?		M	(R-126)	Yes_X_No__
OAM.21	Does the implementation increment SES-IMA for every one second interval containing one or more LIF link defects, except during seconds when an UAS-IMA condition is reported, as indicated in Table 19 on page 77?		M	(R-126)	Yes_X_No__
OAM.22	Does the implementation increment SES-IMA for every one second interval containing one or more LODS link defects, except during seconds when a UAS-IMA condition is reported, as indicated in Table 19 on page 77?		M	(R-126)	Yes_X_No__
OAM.23	Does the implementation increment SES-IMA-FE for every one second interval containing one or more RDI-IMA defect, except during seconds when a UAS-IMA-FE condition is reported, as indicated in Table 19 on page 77?		M	(R-127)	Yes_X_No__
OAM.24	Does the period of NE unavailability begin at the onset of 10 contiguous SES-IMA (including the first 10 seconds to enter the UAS-IMA condition), as indicated in Table 19 on page 77?		M	(R-128)	Yes_X_No__
OAM.25	Does the period of NE unavailability end at the onset of 10 contiguous seconds with no SES-IMA (excluding the last 10 seconds to exit the UAS-IMA condition), as indicated in Table 19 on page 77?		M	(R-128)	Yes_X_No__
OAM.26	Does the implementation increment UAS-IMA for each one second interval when the UAS-IMA condition is reported, as indicated in Table 19 on page 77?		M	(R-128)	Yes_X_No__
OAM.27	Does the period of FE unavailability begin at the onset of 10 contiguous SES-IMA (including the first 10 seconds to enter the UAS-IMA condition), as indicated in Table 19 on page 77?		M	(R-129)	Yes_X_No__
OAM.28	Does the period of FE unavailability end at the onset of 10 contiguous seconds with no SES-IMA-FE (excluding the last 10 seconds to exit the UAS-IMA-FE condition), as indicated in Table 19 on page 77?		M	(R-129)	Yes_X_No__
OAM.29	Does the implementation increment UAS-IMA-FE for each one second interval when the UAS-IMA-FE condition is reported, as indicated in Table 19 on page 77?		M	(R-129)	Yes_X_No__
OAM.30	Does the implementation increment Tx-UUS-IMA for each second when the NE Tx LSM is Unusable, as indicated in Table 19 on page 77?		M	(R-130)	Yes_X_No__

Table A-8. IMA Interface OAM Operation Functions *(3 of 5)*

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
OAM.31	Does the implementation increment Rx-UUS-IMA for each second when the NE Rx LSM is Unusable, as indicated in Table 19 on page 77?		M	(R-131)	Yes_X_No__
OAM.32	Does the implementation increment Tx-UUS-IMA-FE for each second when the FE Tx LSM is reported Unusable, as indicated in Table 19 on page 77?		M	(R-132)	Yes_X_No__
OAM.33	Does the implementation increment Rx-UUS-IMA-FE for each second when the FE Rx LSM is reported Unusable, as indicated in Table 19 on page 77?		M	(R-133)	Yes_X_No__
OAM.34	Does the implementation increment Tx-FC each time the Tx-Mis-Connected link failure condition is entered, as indicated in Table 19 on page 77?		M	(R-134)	Yes_X_No__
OAM.35	Does the implementation increment Tx-FC each time the Tx-Fault link failure condition is entered, as indicated in Table 19 on page 77?		M	(R-134)	Yes_X_No__
OAM.36	Does the implementation increment Rx-FC each time the LIF link failure condition is entered, as indicated in Table 19 on page 77?		M	(R-135)	Yes_X_No__
OAM.37	Does the implementation increment Rx-FC each time the LODS link failure condition is entered, as indicated in Table 19 on page 77?		M	(R-135)	Yes_X_No__
OAM.38	Does the implementation increment Rx-FC each time the Rx-Mis-Connected link failure condition is entered, as indicated in Table 19 on page 77?		M	(R-135)	Yes_X_No__
OAM.39	Does the implementation increment Rx-FC each time the Rx-Fault link failure condition is entered, as indicated in Table 19 on page 77?		M	(R-135)	Yes_X_No__
OAM.40	Does the implementation increment Tx-FC-FE each time the Tx-Unusable-FE link failure condition is entered, as indicated in Table 19 on page 77?		O	(O-21)	Yes_X_No__
OAM.41	Does the implementation increment Rx-FC-FE each time the RFI-IMA link failure condition is entered, as indicated in Table 19 on page 77?		O	(O-22)	Yes_X_No__
OAM.42	Does the implementation increment Rx-FC-FE each time the Rx-Unusable-FE link failure condition is entered, as indicated in Table 19 on page 77?		O	(O-22)	Yes_X_No__
OAM.43	Does the implementation increment Tx-Stuff-IMA for each stuff event inserted in the transmit direction, as indicated in Table 19 on page 77?		O	(O-23)	Yes_X_No__
OAM.44	Does the implementation increment Rx-Stuff-IMA for each stuff event detected in the receive direction, except during seconds when a SES-IMA or UAS-IMA condition is reported, as indicated in Table 19 on page 77?		O	(O-24)	Yes_X_No__
OAM.45	Does the implementation increment GR-UAS-IMA for each second when the GTSM is down, as indicated in Table 19 on page 77?		M	(R-136)	Yes_X_No__

Table A-8. IMA Interface OAM Operation Functions (4 of 5)

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
OAM.46	Does the implementation increment GR-FC each time the Config-Aborted group failure condition is entered, as indicated in Table 19 on page 77?		M	(R-137)	Yes_X_No__
OAM.47	Does the implementation increment GR-FC each time the Insufficient-Links group failure condition is entered, as indicated in Table 19 on page 77?		M	(R-137)	Yes_X_No__
OAM.48	Does the implementation increment GR-FC-FE each time the Start-up-FE group failure condition is entered, as indicated in Table 19 on page 77?		O	(O-25)	Yes_X_No__
OAM.49	Does the implementation increment GR-FC-FE each time the Config-Aborted-FE group failure condition is entered, as indicated in Table 19 on page 77?		O	(O-25)	Yes_X_No__
OAM.50	Does the implementation increment GR-FC-FE each time the Insufficient-Links-FE group failure condition is entered, as indicated in Table 19 on page 77?		O	(O-25)	Yes_X_No__
OAM.51	Does the implementation increment GR-FC-FE each the Blocked-FE group failure condition is entered, as indicated in Table 19 on page 77?		O	(O-25)	Yes_X_No__
OAM.52	Does the implementation accumulate IMA performance parameters over 15 minute intervals?		O	(O-26)	Yes_X_No__
OAM.53	Does the implementation accumulate IMA performance parameters over 24 hour intervals?		O	(O-27)	Yes__ No_X_
OAM.54	Does the implementation keep the current/previous and recent data?	(O-26)	M	(CR-7)	Yes_X_No__
OAM.55	Does the implementation use the current data for threshold crossing?	(O-26)	M	(CR-8)	Yes__ No_X_
OAM.56	Does the implementation keep the current/previous and recent data?	(O-27)	M	(CR-9)	Yes__ No_X_
OAM.57	Does the implementation use the current data for threshold crossing?	(O-27)	M	(CR-10)	Yes__ No_X_
OAM.58	Does the implementation report a LIF failure alarm for the persistence of a LIF defect at the NE?		M	(R-138)	Yes_X_No__
OAM.59	Does the implementation report a LODS failure alarm for the persistence of a LODS defect at the NE?		M	(R-139)	Yes_X_No__
OAM.60	Does the implementation report a RFI-IMA failure alarm for the persistence of a RDI-IMA defect at the NE?		M	(R-140)	Yes_X_No__
OAM.61	Does the implementation report Tx-Mis-Connected failure alarm when the Tx link is detected as mis-connected?		M	(R-141)	Yes_X_No__
OAM.62	Does the implementation report Rx-Mis-Connected failure alarm when the Rx link is detected as mis-connected?		M	(R-142)	Yes_X_No__
OAM.63	Does the implementation report a Tx Fault failure alarm for any implementation specific Tx fault declared at the NE?		O	(O-28)	Yes__ No_X_

Table A-8. IMA Interface OAM Operation Functions (5 of 5)

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
OAM.64	Does the implementation report a Rx Fault failure alarm for any implementation specific Rx fault declared at the NE?		O	(O-29)	Yes__ No_X_
OAM.65	Does the implementation report a Tx-Unusable-FE failure alarm when it receives Tx-Unusable from FE?		M	(R-143)	Yes_X_No__
OAM.66	Does the implementation report a Rx-Unusable-FE failure alarm when it receives Rx-Unusable from FE?		M	(R-144)	Yes_X_No__
OAM.67	Does the implementation report a Start-up-FE failure alarm when it receives this signal from FE (the declaration of this failure alarm may be delayed to ensure the FE remains in Start-up)?		M	(R-145)	Yes_X_No__
OAM.68	Does the implementation report a Config-Aborted failure alarm when the FE tries to use unacceptable configuration parameters?		M	(R-146)	Yes_X_No__
OAM.69	Does the implementation report a Config-Aborted-FE failure alarm when the FE reports unacceptable configuration parameters?		M	(R-147)	Yes_X_No__
OAM.70	Does the implementation report an Insufficient-Links failure alarm when less than P_{Tx} transmit links or P_{Rx} receive links are active?		M	(R-148)	Yes_X_No__
OAM.71	Does the implementation report an Insufficient-Links-FE failure alarm when the FE reports that less than P_{Tx} transmit links or P_{Rx} receive links are active?		M	(R-149)	Yes_X_No__
OAM.72	Does the implementation report a Blocked-FE failure alarm when the FE reports that it is blocked?		M	(R-150)	Yes_X_No__
OAM.73	Does the implementation report GR-Timing-Mismatch when the FE transmit clock mode is different than the NE transmit clock mode?		M	(R-151)	Yes_X_No__
OAM.74	In the case of the LIF, LODS, RFI-IMA and Fault failure alarms, does the implementation support 2.5 ± 0.5 seconds as a default persistence checking time to enter a failure alarm condition?		M	(R-152)	Yes_X_No__
OAM.75	In the case of the LIF, LODS, RFI-IMA and Fault failure alarms, does the implementation support 10 ± 0.5 seconds as a default persistence clearing time to exit the failure alarm condition?		M	(R-152)	Yes_X_No__
OAM.76	In the case of the LIF, LODS, RFI-IMA and Fault failure alarms, does the IMA allow configuration of other values for default persistence checking time to enter a failure alarm condition?		O	(O-30)	Yes_X_No__
OAM.77	In the case of the LIF, LODS, RFI-IMA and Fault failure alarms, does the IMA allow configuration of other values for default persistence checking time to exit the same failure alarm condition?		O	(O-30)	Yes_X_No__
OAM.78	Does the implementation ensure that the Tx-Fault failure alarm, as defined in (O-28) on page 79, is not cleared until the fault that led to the declaration of the alarm is no longer present for the duration specified to clear the alarm in (R-152) on page 80?	(O-28)	M	(CR-11)	Yes__ No_X_
OAM.79	Does the implementation ensure that the Rx-Fault failure alarm, as defined in (O-29) on page 79, is not cleared until the fault that led to the declaration of the alarm is no longer present for the duration specified to clear the alarm in (R-152) on page 80?	(O-29)	M	(CR-12)	Yes__ No_X_
Comments: 24 hour PM intervals require external software. No threshold crossing feature in driver. Link Fault failures are not defined in standard.					

Table A-9. Test Pattern Procedure (TPP) Functions

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
TPP.1	Does the implementation activate the Test Pattern procedure in the transmit direction?		O	(O-31)	Yes_X_No__
TPP.2	Does the implementation use the Test Link Command field in the ICP cell (as defined in the Tx Test Control field in Table 2 on page 31) to request the FE to activate the loop back of the test pattern contained in the Tx Test Pattern field?	(O-31)	M	(CR-12)	Yes_X_No__
TPP.3	Does the implementation use the Tx LID field defined in the Tx Test Control field in Table 2 on page 31 to identify to the FE which transmit link the FE should extract the Tx Test Pattern from in the received ICP cells?	(O-31)	M	(CR-12)	Yes_X_No__
TPP.4	Does the implementation send any changed values of the Test Link Command, Tx LID and Tx Test Pattern fields in ICP cells for at least 2 consecutive IMA frames over each link within the IMA group?	(O-31)	M	(CR-12)	Yes_X_No__
TPP.5	Does the implementation continue to send the same values of the Test Link Command, Tx LID and Tx Test Pattern fields as long a*s* the IMA transmitter wants the FE IMA unit to loop back the test pattern?	(O-31)	M	(CR-12)	Yes_X_No__
TPP.6	Does the implementation monitor the incoming ICP cells on the links already recognized in the group to detect a change of the Test Link Command?		M	(R-153)	Yes_X_No__
TPP.7	If the Test Link Command field is detected as active over the links already recognized in the group and over the test link, does the implementation copy the value of the Tx Test Pattern field received from the test link, indicated over the Tx LID field, into the Rx Test Pattern field on every subsequent ICP cell sent over all outgoing links in the group?		M	(R-154)	Yes_X_No__
TPP.8	Does the implementation continue sending the same value over the Rx Test Pattern field until the IMA transmitter has received an indication to stop looping the pattern, to loop a new pattern received from the same link over the Tx Test Pattern, or to loop the test pattern received from another link (indicated over the Tx LID field)?		M	(R-155)	Yes_X_No__
TPP.9	Does the implementation return the "0xFF" pattern over the Rx Test Pattern field when the incoming test command is inactive or the test link is not detected?		M	(R-156)	Yes_X_No__
TPP.10	Does the implementation only handle one test pattern per IMA group at any given time?		M	(R-157)	Yes_X_No__
Comments:					

Table A-10. IMA Interaction with Plane Management Functions

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
IPM.1	Does the implementation process IMA group configuration indications received from the Plane Management?		M	(R-158)	Yes_X_No__
IPM.2	Does the implementation process IMA link addition/deletion indications received from the Plane Management?		M	(R-158)	Yes_X_No__
IPM.3	Does the implementation send IMA service operational status change indications to the Plane Management?		M	(R-158)	Yes_X_No__
IPM.4	Does the implementation send Tx/Rx cell rate change indications to the Plane Management?		M	(R-158)	Yes_X_No__
Comments: Plane Management software required to interface with driver API.					

Table A-11. Management Information Base (MIB) Functions

Item	Protocol feature	Cond. for Status	Status Pred.	Ref.	Support
MIB.1	Does the implementation support a UM based on SNMP?		O	(O-32)	Yes_X_No__
MIB.2	Does the implementation implement the mandatory objects in the IMA-MIBs defined in Appendix A on page 106?	(O-32)	M	(CR-17)	Yes__ No_X
MIB.3	Does the implementation implement the optional objects in the IMA MIBs defined in Appendix A on page 106?	(O-32)	O	(O-33)	Yes__ No_X
Comments: Support for MIB objects implemented. Requires SNMP agent software to create MIB using driver API.
