Electrical Characteristics 2

1. Video S/N	50dB (min.), 58dB (typ.)
2. Video amplitude frequency characteristics (at 1MHz reference)	Within ± 1 dB at 0.5 to 5MHz
3. APL variation (Normalized to APL 50%)	Within $\pm 2\%$ at 10 to 90%

- *1. Spectrum analyzer with 50 Ω input impedance should be used to test video output level. Measured value V_o (dBm) is used to calculate output according to following relationship:

$$\text{Output (dB } \mu\text{)} = V_o \text{ (dBm)} + 107 \text{ 50 } \Omega \text{ terminal direct reading value}$$
- *2. Measured after demodulating by standard demodulator.
- *3. $f_c + 2$ MHz component of V_1 carrier (f_c) level.
- *4. Adjust the V_2 level to obtain an FM deviation of ± 30 kHz and measure the harmonic distortion after demodulating V_o with a standard demodulator.
- *5. Value determined by measuring ratio (dB) of chroma beat to video carrier level when V_1 =no signal by spectrum analyzer.
- *6. R1 (12k Ω) of the Electrical Characteristics Test Circuit is added for obtaining a better match between the audio modulation sensitivity classifications and the actual pre-emphasis.
