

Four Outputs PCI-Express Clock Generator

Features

- 25 MHz Crystal or Clock Input
- Four Differential 100 MHz PCI-Express Clocks
- Supports HCSL Compatible Output Levels
- One Single-ended 25 MHz Output
- Spread Spectrum Capability on all 100 MHz PCI-Express Clock Outputs
- SMBus Interface with Read Back Capability
- 32-pin QFN Package
- Operating Voltage 3.3 V
- Commercial and Industrial Operating Temperature Range

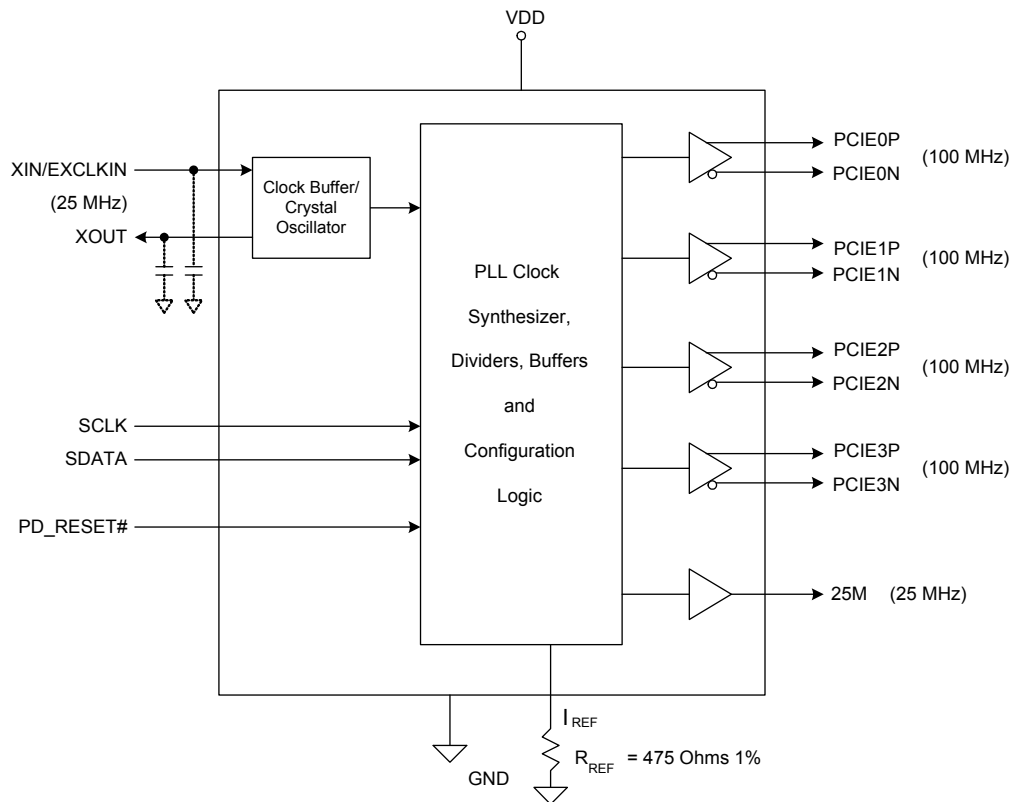

Functional Description

CY24292 is a clock generator device intended for PCI-Express applications. The device includes: four 100 MHz differential clocks with HCSL Compatible outputs for PCI-Express, and one single-ended 25 MHz output.

Using a serially programmable SMBus interface, the CY24292 incorporates spread spectrum modulation on all four 100 MHz outputs. The device incorporates a Lexmark Spread Spectrum profile for maximum electromagnetic interference (EMI) reduction. The spread feature or individual outputs can also be disabled using the SMBus interface.

Pin Definitions

Pin Number	Pin Name	Pin Type	Description
1	PCI E1P	Output	Differential 100 MHz PCI-Express true clock output. High impedance when disabled.
2	PCI E1N	Output	Differential 100 MHz PCI-Express complementary clock output. High impedance when disabled.
3	GND	Power	Ground
4	IREF	Output	Current set for all differential clock drivers. Connect 475 Ω resistor to ground.
5	PCI E2N	Output	Differential 100 MHz PCI-Express complementary clock output. High impedance when disabled.
6	PCI E2P	Output	Differential 100 MHz PCI-Express true clock output. High impedance when disabled.
7	GND	Power	Ground
8	VDD	Power	3.3 V Power supply
9	PCI E3N	Output	Differential 100 MHz PCI-Express complementary clock output. High impedance when disabled.
10	PCI E3P	Output	Differential 100 MHz PCI-Express true clock output. High impedance when disabled.
11	VDD	Power	3.3 V Power supply
12	PCI E0P	Output	Differential 100 MHz PCI-Express true clock output. High impedance when disabled.
13	PCI E0N	Output	Differential 100 MHz PCI-Express complementary clock output. High impedance when disabled.
14	SCLK	Input	SMBus clock input
15	SDATA	Input	SMBus data input
16	VDD	Power	3.3 V Power supply
17	GND	Power	Ground

Pin Definitions (continued)

Pin Number	Pin Name	Pin Type	Description
18	VDD	Power	3.3 V Power supply
19	GND	Power	Ground
20	PD_RESET#	Input	Global reset pin. Powers down PLLs, disables outputs and sets the SMBus tables to their default state when pulled low. Has internal weak pull up.
21	VDD	Power	3.3 V Power supply
22	XIN/EXCLKIN	Input	Crystal or clock input. Connect to 25 MHz fundamental mode crystal or clock.
23	XOUT	Output	Crystal output. Connect to 25 MHz fundamental mode crystal. Float for clock input.
24	VDD	Power	3.3 V Power supply
25	NC	–	No connect. Pin has no internal connection.
26	25M	Output	25 MHz Single-ended LVCMOS output. Pull-down when disabled by PD_RESET#. Driven low when individually disabled (via SMBus byte 0, bit 0).
27	GND	Power	Ground
28	VDD	Power	3.3 V Power supply
29	GND	Power	Ground
30	VDD	Power	3.3 V Power supply
31	GND	Power	Ground
32	VDD	Power	3.3 V Power supply

SMBus Serial Data Interface

A two-signal serial interface is provided to enhance the flexibility and function of the clock synthesizer. Through the serial data interface, various device functions such as clock output buffers can be individually enabled or disabled. The registers associated with the serial data interface initialize to their default setting upon power up, and therefore this interface is optional. Clock device register changes are normally made upon system initialization, if required. This is a RAM-based technology which does not keep its value when power is off or during a power transition.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write and read operation, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte is transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code, as described in [Table 1](#).

The block write and block read protocol is outlined in [Table 2](#), while [Table 3](#) outlines the corresponding byte write and byte read protocol. The slave receiver address is 11010010 (D2h) for write and 11010011 (D3h) for read.

Table 1. Command Code Definition

Bit	Description
7	0 = block read or block write operation, 1 = byte read or byte write operation
(6:0)	Byte offset for byte read or byte write operation. For block read or block write operations, these bits must be '000000'

The state of the clock outputs upon assertion of the PD_RESET# signal from input pin or Global OE control bit from byte 0, bit 5 of the SMBus is shown in the following table.

Table 11. Power Down Reset Table

H/W PD_RESET# (pin 24)	S/W PD_RESET# (Byte 0 bit 5)	All Clock Outputs
0	0	Disabled, Hi-Z. 25M has weak pull-down.
0	1	Disabled, Hi-Z. 25M has weak pull-down.
1	0	Disabled, Hi-Z. 25M has weak pull-down.
1	1	Enabled

Application Information

Crystal Recommendations

The CY24292 requires a parallel resonance crystal. Substituting a series resonance crystal causes the CY24292 to operate at the wrong frequency and violate the ppm specification. For most applications there is a 300 ppm frequency shift between the series and parallel crystals due to incorrect loading.

Table 12. Crystal Recommendations

Frequency	Cut	Load Cap (max)	Eff Series Rest (max)	Drive (max)	Tolerance (max)	Stability (max)	Aging (max)
25.00 MHz	Parallel	16 pF	30 Ω	1.0 mW	30 ppm	10 ppm	5 ppm/yr

Crystal Loading

Crystal loading plays a critical role in achieving low ppm performance. To realize low ppm performance, consider the total capacitance the crystal sees to calculate the appropriate capacitive loading (CL).

Figure 2 shows a typical crystal configuration using two trim capacitors. It is important to note that the trim capacitors in series with the crystal are not parallel. It is a common misconception that load capacitors are in parallel with the crystal and are approximately equal to the load capacitance of the crystal. This is not true.

Calculating Load Capacitors

In addition to the standard external trim capacitors, the trace capacitance and pin capacitance must also be considered to correctly calculate crystal loading.

As mentioned in the previous section, the capacitance on each side of the crystal is in series with the crystal. This means the total capacitance on each side of the crystal must be twice the specified crystal load capacitance (CL). While the capacitance on each side of the crystal is in series with the crystal, the trim capacitors (Ce1, Ce2) must be calculated to provide equal capacitive loading on both sides.

Figure 2. Crystal Loading Example

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

Load capacitance (each side)

$$C_e = 2 * CL - (C_s + C_i)$$

Total capacitance (as seen by the crystal)

$$CL_e = \frac{1}{\left(\frac{1}{C_{e1} + C_{s1} + C_{i1}} + \frac{1}{C_{e2} + C_{s2} + C_{i2}}\right)}$$

- CL..... Crystal load capacitance
- CLe..... Actual loading seen by crystal using standard value trim capacitors
- Ce..... External trim capacitors
- Cs..... Stray capacitance (terraced)
- Ci..... Internal capacitance

Current Source (Iref) Reference Resistor

If the board target trace impedance (Z) is 50 Ω, then for R_{REF} = 475 Ω (1%) provides I_{REF} of 2.32 mA. The output current (I_{OH}) is equal to 6 × I_{REF}.

Output Termination

The PCI-Express differential clock outputs of CY24292 are open source drivers and require an external series resistor and a resistor to ground. These resistor values and their allowable locations are explained in detail in the section [PCI-Express Layout Guidelines on page 9](#).

PCB Layout Recommendations

For optimum device performance and lowest phase noise, the following guidelines must be observed.

1. Each 0.01 μF decoupling capacitor must be mounted on the component side of the board as close to the VDD pin as possible.
2. No vias must be used between the decoupling capacitor and the VDD pin.
3. The PCB trace to the VDD pin and the ground via must be kept as short as possible. The distance of the ferrite bead and bulk decoupling from the device is less critical.

4. An optimum layout is one with all components on the same side of the board, minimizing vias through other signal layers (any ferrite beads and bulk decoupling capacitors can be mounted on the back). Other signal traces must be routed away from the CY24292. This includes signal traces just underneath the device, or on layers adjacent to the ground plane layer used by the device.

Decoupling Capacitors

Decoupling capacitors of 0.01 μF must be connected between VDD and GND as close to the device as possible. Do not share ground vias between components. Route power from power source through the capacitor pad, and then into the CY24292 pin.

PCI-Express Layout Guidelines

HCSL Compatible Layout Guidelines

Table 13. Common Recommendations for Differential Routing

Differential Routing ^[1]	Dimension or Value	Unit
L1 length, route as non-coupled 50 Ω trace	0.5 max	inch
L2 length, route as non-coupled 50 Ω trace	0.2 max	inch
L3 length, route as non-coupled 50 Ω trace	0.2 max	inch
R_S	33	Ω
R_T	49.9	Ω

Table 14. Differential Routing for PCI-Express Load or Connector

Differential Routing ^[1]	Dimension or Value	Unit
L4 length, route as coupled microstrip 100 Ω differential trace	2 to 32	inch
L4 length, route as coupled stripline 100 Ω differential trace	1.8 to 30	inch

SP_{MOD}	Spread modulation frequency		30	32	33	kHz
T_{CCJ}	Cycle-to-cycle jitter ^[4]		–	–	90	ps
T_{PHJ}	Peak-to-peak phase jitter ^[4,5]		–	–	86	ps
T_{DC}	Output clock duty cycle ^[4]		45	50	55	%
ER_R	Rising edge rate ^[4,6]	See notes 5 and 7	0.6	–	4.0	V/ns
ER_F	Falling edge rate ^[4,6]	See notes 5 and 7	0.6	–	4.0	V/ns
V_{CROSS}	Absolute crossing point voltage ^[7,8,9]	See notes 8, 9, and 10	0.25	0.35	0.55	V
V_{Xdelta}	Variation of V_{CROSS} over all rising clock edges ^[7,8,10]	See notes 8, 9, and 11	–	–	140	mV
$T_{PERIOD\ AVG}$	Average clock period accuracy ^[4,11]	See notes 5 and 12	-300	–	2800	ppm
$T_{PERIOD\ ABS}$	Absolute clock period ^[4,12]	See notes 5 and 13	9.847	–	10.203	ns
$T_{OSKEW\ ALL}$	Output skew, all pairs ^[13]	Measured at V_{CROSS} point See note 14	–	–	100	ps
$T_{OSKEW\ P-P}$	PCIE0P/N to PCIE3P/N skew and PCIE1P/N to PCIE2P/N skew ^[13]	Measured at V_{CROSS} point See note 14	–	–	50	ps
T_{OEPD}	Output enable from power down reset	PD_RESET# going high to 99% of final frequency	–	–	2	ms
T_{LOCK}	Clock stabilization from power up	Measured from 90% of the applied power supply level	–	1	2	ms

Notes

- Measured with $C_{load} = 15\text{ pF}$ lumped load
- Measurement taken from differential waveform (PCIEP minus PCIEEN). Either single ended probes with math or a differential probe can be used.
- Phase jitter is determined using data captured on an oscilloscope at a sample rate of 20 GS/sec, for a minimum 100,000 continuous clock periods. This data is then processed using the ClockJitter 1.3.0 software from PCISIG, using the PCI_E_1_1 template.
- Measured from -150 mV to $+150\text{ mV}$ on the differential waveform (derived from PCIEP minus PCIEEN). The signal must be monotonic through the measurement region for rise and fall time. The 300 mV measurement window is centered on the differential zero crossing.
- Measurement taken from a single-ended waveform.
- Measured at crossing point where the instantaneous voltage value of the rising edge of PCIEP equals the falling edge of PCIEEN.
- Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing. Refers to all crossing points for this measurement.
- Defined as the total variation of all crossing voltages of Rising PCIEP and Falling PCIEEN. This is the maximum allowed variance in V_{CROSS} for any particular system.
- PPM refers to parts per million and is a DC absolute period accuracy specification. 1 PPM is 1/1,000,000th of 100,000,000 MHz exactly, or 100 Hz. For 300 PPM then we have an error budget of 30 kHz. The period is to be measured with a frequency counter with measurement window set to 100 ms or greater. The ± 300 PPM applies to systems that do not employ Spread Spectrum or that use common clock source. For systems employing Spread Spectrum, there is an additional 2500 PPM nominal shift in maximum period resulting from the 0.5% down spread, resulting in a maximum average period specification of +2800 PPM.
- Defined as the absolute minimum or maximum instantaneous period. This includes cycle-to-cycle jitter, relative PPM tolerance, and spread spectrum modulation.
- Measured at the rising 0V point of the differential signal. Skew is the time difference of the rising 0V point between any two differential signal pairs. The measurement is taken over 1000 samples, and the average value is used.

**	2490167	PYG / DPF / AESA	See ECN	New data sheet.
*A	2507681	DPF / AESA	05/23/2008	Updated Pin Configuration (Changed pinout based on PCIE_Bonding_Rev G). Updated DC Electrical Characteristics (Added Note 2 and referred the same note in parameter column, added HCSL termination in Condition column for V_{OL2} , V_{OH2}). Updated AC Electrical Characteristics (updated Note 3, added Note 8 and referred the same note in T_{DC} parameter in Table 16, changed Cload from 2 pF to 4 pF in a Note below, added maximum value of V_{Xdelta} (140 mV) in the Table 16). Updated data sheet template.
*B	2811340	CXQ	12/03/2009	Removed "Preliminary" from title. Updated Pin Definitions (Added explanation of 25M output disable feature). Updated Control Registers (Changed default setting (At Power up column) for bit 7 in Table 4 to '1', changed description of bit 5 in Table 4 to 'Global OE bit', added explanation of 25M output disable feature in Table 4, changed unused bits (Type Column) from R/W to R in Table 7, changed default setting (At Power up column) for bit 4 in Table 9 to '1', added explanation of 25M output disable feature in Table 11). Updated the sub-section Crystal Recommendations under the main section Application Information (Added "max" to Load Cap and Eff Series Rest columns in Table 12). Updated sub-section "LVDS Compatible Layout Guidelines" under the main section PCI-Express Layout Guidelines (changed "LVDS Down Device" to "LVDS Device" in all instances). Updated Absolute Maximum Ratings (Changed maximum value of T_J parameter to 125 °C). Updated Recommended Operation Conditions (Added V_{SMB} and R_{REFTOL} parameters and its details). Updated DC Electrical Characteristics (added R_{REF} value to conditions at top, removed V_{OHSD} and V_{OLSD} parameters and their details, changed maximum value of V_{OH2} parameter from 0.85 V to 0.95 V, added V_{OL3} parameter and its details, changed typical value of I_{OH} parameter from -14.2 mA to -15.2 mA, added minimum value of V_{IL1} parameter, changed maximum value of V_{IL1} parameter from 1 V to 0.8 V, changed minimum value of V_{IH1} parameter from 2.2 V to 2.1 V, added typical and maximum values for I_{DD} no load and full load parameters, changed typical value of I_{DDPD} parameter from TBD to 250 μ A, changed maximum value of I_{DDPD} parameter from TBD to 350 μ A, added R_{PU} parameter and its details, changed R_{PD} parameter to apply to 25M output only). Updated AC Electrical Characteristics (added R_{REF} value to conditions at top, removed F_{ERR} parameter and its details in Table 15, added $SP_{PROFILE}$ parameter and its details in Table 16, added minimum and maximum values for SP_{MOD} parameter, changed maximum value of T_{CCJ} parameter from 100 ps to 90 ps in Table 16, added T_{PHJ} parameter and its details in Table 16, changed T_R and T_F parameters and its details into ER_R and ER_F parameters in Table 16, removed $T_{RFMATCH}$ parameter and its details in Table 16, splitted T_{OSKEW} parameter into two parameters namely $T_{OSKEW_{ALL}}$ and $T_{OSKEW_{P-P}}$ parameter and also changed their details in Table 16, added minimum value of V_{CROSS} parameter and also changed the description of the same parameter in Table 16, changed description of V_{Xdelta} parameter in Table 16). Updated Package Diagram (to spec 001-42168 Rev *C). Fixed various typos.
*C	2901711	KVM	05/14/10	Updated Package Diagram .

Document History Page (continued)

Document Title: CY24292, Four Outputs PCI-Express Clock Generator Document Number: 001-46142				
REV.	ECN	Orig. of Change	Submission Date	Description of Change
*D	3448896	PURU	11/28/2011	Updated Features (Removed LVDS related information). Updated Functional Description (Removed LVDS related information). Updated Output Termination under Application Information (Removed LVDS related information). Removed the sub-section "LVDS Compatible Layout Guidelines" under the main section PCI-Express Layout Guidelines . Added Ordering Code Definitions . Added Acronyms and Units of Measure . Updated in new template.
*E	4580588	TAVA	12/05/2014	Added related documentation hyperlink in page 1. Updated package diagram.

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at [Cypress Locations](#).
