CY28416

Next Generation FTG for Intel® Architecture

Features

- Supports Intel Pentium® 4-Type CPUs
- Selectable CPU Frequencies
- Two Differential CPU Clock Pairs
- Four 100-MHz Differential SRC Clock Pairs
- One CPU/SRC Selectable Differential Clock Pair
- One 96-MHz Differential Dot Clock Support
- Two 48-MHz Clocks
- Four 33-MHz PCI Clocks
- Two 33-MHz PCI Free Running Clocks
- Low Voltage Frequency Select Input
- I²C Support Byte/Word/Block Read/Write Capabilities
- Ideal Lexmark Spread Spectrum Profile for Maximum EMI Reduction
- 3.3V Power Supply
- 48-pin SSOP Package

Pin Definition

Pin No.	Name	Type	Description
47,46,44,43	CPUT/C[0:1]	O, DIF	Differential CPU clock output.
39,38	CPUT2_ITP/SRCT4 CPUC2_ITP/SRCC4	O, DIF	Selectable Differential CPU or SRC clock output. ITP_EN = 0 @VTT_PWRGD# assertion PIN 39,38 = SRCT4,SRCC4 ITP_EN = 1 @VTT_PWRGD# assertion PIN 39,38 = CPUT2_ITP,CPUC2_ITP
23,24	DOT96T, DOT96C	O, DIF	Differential 96-MHz clock output
6	FS_A/REF1	I/O, SE	3.3V tolerant input for CPU frequency/REF clock <i>Refer to DC Electrical Specifications table for Vil_FS and Vih_FS specifications.</i>
20	FS_B/48 MHz0	I/O, SE	3.3V tolerant input for CPU frequency/48 MHz clock <i>Refer to DC Electrical Specifications table for Vil_FS and Vih_FS specifications.</i>
7	FS_C/REF0	I/O, SE	3.3V tolerant input for CPU frequency/REF clock <i>Refer to DC Electrical Specifications table for Vil_FS and Vih_FS specifications.</i>
42	IREF	I	A precision resistor is attached to this pin, which is connected to the internal current reference.
18	ITP_EN/PCIF1	I/O, SE	Enable SRC4 or CPU2_ITP/PCIF clock. (sampled on the VTT_PWRGD# assertion). 0 = SRC4, 1 = CPU2_ITP
9,10,13,14	PCI	O, SE	33-MHz clock output.
21	48 MHz1	O, SE	48-MHz clock output. (Uses same control SMBus register as 48 MHz0 to control enable/disable.)
1	SCLK	I	SMBus compatible SCLOCK.
2	SDATA	I/O	SMBus compatible SDATA.
26,27,29,30, 34,35	SRCT/C[0:3]	O, DIF	Differential Serial reference clock.
31,32	SRCT2_SATA, SRCC2_SATA	O, DIF	Differential Serial reference clock. Recommended output for SATA
17	TEST_SEL/PCIF0	I/O, SE, PD	LVTTTL input for selecting HI-Z or Normal operation/33 MHz Clock 0 = Normal operation, 1 = HI-Z when VTT_PWRGD# is sampled
19	VDD_48	PWR	3.3V power supply for outputs
45	VDD_CPU	PWR	3.3V power supply for outputs
11, 16	VDD_PCI	PWR	3.3V power supply for outputs
8	VDD_REF	PWR	3.3V power supply for outputs
33, 37	VDD_SRC	PWR	3.3V power supply for outputs
40	VDDA	PWR	3.3V power supply for PLL
22	VSS_48	GND	Ground for outputs
48	VSS_CPU	GND	Ground for outputs
12, 15	VSS_PCI	GND	Ground for outputs
5	VSS_REF	GND	Ground for outputs
28, 36	VSS_SRC	GND	Ground for outputs
41	VSSA	GND	Ground for PLL
25	VTT_PWRGD#/PD	I, PD	3.3V LVTTTL Input. This pin is a level-sensitive strobe used to latch the FS_A, FS_B, FS_C/TEST_SEL, and PCIF0/ITP_EN Inputs. After asserting VTT_PWRGD# (active LOW), this pin becomes a realtime input for asserting power-down (active HIGH)
4	XIN	I	14.318-MHz Crystal Input
3	XOUT	O	14.318-MHz Crystal Output

Frequency Select Pins (FS_A, FS_B, and FS_C)

Host clock frequency selection is achieved by applying the appropriate logic levels to FS_A, FS_B, FS_C inputs prior to VTT_PWRGD# assertion (as seen by the clock synthesizer). Upon VTT_PWRGD# being sampled LOW by the clock chip (indicating processor VTT voltage is stable), the clock chip samples the FS_A, FS_B, and FS_C input values. For all logic levels of FS_A, FS_B, and FS_C VTT_PWRGD# employs a one-shot functionality in that once a valid LOW on VTT_PWRGD# has been sampled, all further VTT_PWRGD#, FS_A, FS_B, and FS_C transitions will be ignored, except in test mode.

Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers, can be individually enabled or disabled. The registers associated with the Serial Data Interface initial-

izes to their default setting upon power-up, and therefore use of this interface is optional. Clock device register changes are normally made upon system initialization, if any are required. The interface cannot be used during system operation for power management functions.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write/read operation, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code, as described in *Table 2*.

The block write and block read protocol is outlined in *Table 3* while *Table 4* outlines the corresponding byte write and byte read protocol. The slave receiver address is 11010010 (D2h).

Crystal Recommendations

The CY28416 requires a **Parallel Resonance Crystal**. Substituting a series resonance crystal will cause the CY28416 to operate at the wrong frequency and violate the ppm specification. For most applications there is a 300-ppm frequency shift between series and parallel crystals due to incorrect loading.

Crystal Loading

Crystal loading plays a critical role in achieving low ppm performance. To realize low ppm performance, the total capacitance the crystal will see must be considered to calculate the appropriate capacitive loading (CL).

Figure 1 shows a typical crystal configuration using the two trim capacitors. An important clarification for the following discussion is that the trim capacitors are in series with the crystal, not parallel. It's a common misconception that load capacitors are in parallel with the crystal and should be approximately equal to the load capacitance of the crystal. This is **not true**.

Figure 1. Crystal Capacitive Clarification
Calculating Load Capacitors

In addition to the standard external trim capacitors, trace capacitance and pin capacitance must also be considered to correctly calculate crystal loading. As mentioned previously, the capacitance on each side of the crystal is in series with the crystal. This means the total capacitance on each side of the crystal must be twice the specified crystal load capacitance (CL). While the capacitance on each side of the crystal is in series with the crystal, trim capacitors (Ce1,Ce2) should be calculated to provide equal capacitive loading on both sides.

Figure 2. Crystal Loading Example

As mentioned previously, the capacitance on each side of the crystal is in series with the crystal. This means the total capacitance on each side of the crystal must be 2 times the specified load capacitance (CL). While the capacitance on each side of the crystal is in series with the crystal, trim capacitors (Ce1,Ce2) should be calculated to provide equal capacitance loading on both sides.

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

Load Capacitance (each side)

$$C_e = 2 * C_L - (C_s + C_i)$$

Total Capacitance (as seen by the crystal)

$$C_{Le} = \frac{1}{\left(\frac{1}{C_{e1} + C_{s1} + C_{i1}} + \frac{1}{C_{e2} + C_{s2} + C_{i2}}\right)}$$

- CL Crystal load capacitance
- CLe Actual loading seen by crystal using standard value trim capacitors
- Ce External trim capacitors
- Cs Stray capacitance (terraced)
- Ci Internal capacitance (lead frame, bond wires etc.)

PD (Power-down) Clarification

The VTT_PWRGD# /PD pin is a dual function pin. During initial power-up, the pin functions as VTT_PWRGD#. Once VTT_PWRGD# has been sampled low by the clock chip, the pin assumes PD functionality. The PD pin is an asynchronous active high input used to shut off all clocks cleanly prior to shutting off power to the device. This signal needs to be synchronized internal to the device prior to powering down the clock synthesizer. PD is also an asynchronous input for powering up the system. When PD is asserted high, all clocks need to be driven to a low value and held prior to turning off the VCOs and the crystal oscillator.

PD (Power-down)—Assertion

When PD is sampled high by two consecutive rising edges of CPUC, all single-ended outputs must be held low on their next high to low transition and differential clocks must held high or tri-stated (depending on the state of the control register drive mode bit) on the next diff clock# high to low transition. When the SMBus PD drive mode bit corresponding to the differential (CPU, SRC, and DOT) clock output of interest is programmed to '0', the clock output must be held with "Diff clock" pin driven high at 2 x Iref, and "Diff clock#" tristate. If the control register PD drive mode bit corresponding to the output of interest is programmed to "1", then both the "Diff clock" and the "Diff clock#" are tri-state. Note the example in *Figure 3* shows CPUT = 133 MHz and PD drive mode = '1' for all differential outputs. This diagram and description is applicable to valid CPU frequencies 100, 133, 166, 200, 266, 333, and 400 MHz. In the event that PD mode is desired as the initial power-on state, PD must be asserted high in less than 10 μs after asserting VTT_PWRGD#.

PD Deassertion

The power-up latency needs to be less than 1.8 ms. This is the time from the deassertion of the PD pin or the ramping of the power supply until the time that stable clocks are output from the clock chip. All differential outputs stopped in a tristate condition resulting from power down must be driven high in less than 300 μs of PD deassertion to a voltage greater than 200 mV. After the clock chip's internal PLL is powered up and locked, all outputs are to be enabled within a few clock cycles of each other. *Figure 4* is an example showing the relationship of clocks coming up. Unfortunately, we can not show all possible combinations, designers need to insure that from the first active clock output to the last takes no more than two full PCI clock cycles.

T _R / T _F	CPUT and CPUC Rise and Fall Times	Measured from V _{OL} = 0.175 to V _{OH} = 0.525V	175	700	ps
T _{RFM}	Rise/Fall Matching	Determined as a fraction of 2*(T _R – T _F)/(T _R + T _F)	–	20	%
ΔT _R	Rise Time Variation		–	125	ps
ΔT _F	Fall Time Variation		–	125	ps
V _{HIGH}	Voltage High	Math averages <i>Figure 7</i>	660	850	mv
V _{LOW}	Voltage Low	Math averages <i>Figure 7</i>	–150	–	mv
V _{OX}	Crossing Point Voltage at 0.7V Swing		250	550	mv
V _{OVS}	Maximum Overshoot Voltage		–	V _{HIGH} + 0.3	V
V _{UDS}	Minimum Undershoot Voltage		–0.3	–	V
V _{RB}	Ring Back Voltage	See <i>Figure 7</i> . Measure SE	–	0.2	V
SRC					
T _{DC}	SRCT and SRCC Duty Cycle	Measured at crossing point V _{OX}	45	55	%
T _{PERIOD}	100-MHz SRCT and SRCC Period	Measured at crossing point V _{OX}	9.9970	10.003	ns
T _{PERIODSS}	100-MHz SRCT and SRCC Period, SSC	Measured at crossing point V _{OX}	9.9970	10.0533	ns
T _{SKEW}	Any SRCT/C to SRCT/C Clock Skew	Measured at crossing point V _{OX}	–	100	ps
T _{CCJ}	SRCT/C Cycle to Cycle Jitter	Measured at crossing point V _{OX}	–	125	ps

AC Electrical Specifications (continued)

Parameter	Description	Condition	Min.	Max.	Unit
L _{ACC}	SRCT/C Long Term Accuracy	Measured at crossing point V _{OX}	–	300	ppm
