Functional Description[1]

The CY62167DV30 is a high-performance CMOS static RAM organized as 1M words by 16 bits. This device features advanced circuit design to provide ultra-low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power-down feature that significantly reduces power consumption by 99% when addresses are not toggling. The device can also be put into standby mode when deselected ($\overline{CE}_1$ HIGH or CE_2 LOW or both $\overline{BHE}$ and $\overline{BLE}$ are HIGH). The input/output pins (I/O_0 through I/O_{15}) are placed in a high-impedance state when: deselected ($\overline{CE}_1$ HIGH or CE_2 LOW), outputs are disabled ($\overline{OE}$ HIGH), both Byte High Enable and Byte Low Enable are disabled ($\overline{BHE}$, $\overline{BLE}$ HIGH), or during a Write operation ($\overline{CE}_1$ LOW, CE_2 HIGH and $\overline{WE}$ LOW).

Writing to the device is accomplished by taking Chip Enables ($\overline{CE}_1$ LOW and CE_2 HIGH) and Write Enable ($\overline{WE}$) input LOW. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from I/O pins (I/O_0 through I/O_7), is written into the location specified on the address pins (A_0 through A_{19}). If Byte High Enable ($\overline{BHE}$) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{19}).

Reading from the device is accomplished by taking Chip Enables ($\overline{CE}_1$ LOW and CE_2 HIGH) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from the memory location specified by the address pins will appear on I/O_0 to I/O_7. If Byte High Enable ($\overline{BHE}$) is LOW, then data from memory will appear on I/O_8 to I/O_{15}. See the truth table at the back of this data sheet for a complete description of Read and Write modes.

Notes:
2. NC pins are not connected on the die.
3. DNU pins have to be left floating.
4. The BYTE pin in the 48-TSOPI package has to be tied HIGH to use the device as a 1M × 16 SRAM. The 48-TSOPI package can also be used as a 2M × 8 SRAM by tying the BYTE signal LOW. For 2M × 8 Functionality, please refer to the CY62168DV30 datasheet. In the 2M × 8 configuration, Pin 45 is A20.
5. Ball H6 for the FBGA package can be used to upgrade to a 32M density.

Notes:
10. Tested initially and after any design or process changes that may affect these parameters.

13. BHE.BLE is the AND of both BHE and BLE. Chip can be deselected by either disabling the chip enable signals or by disabling both BHE and BLE.

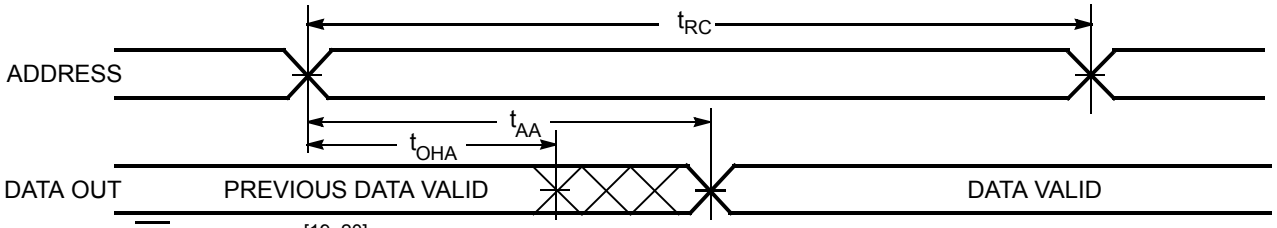
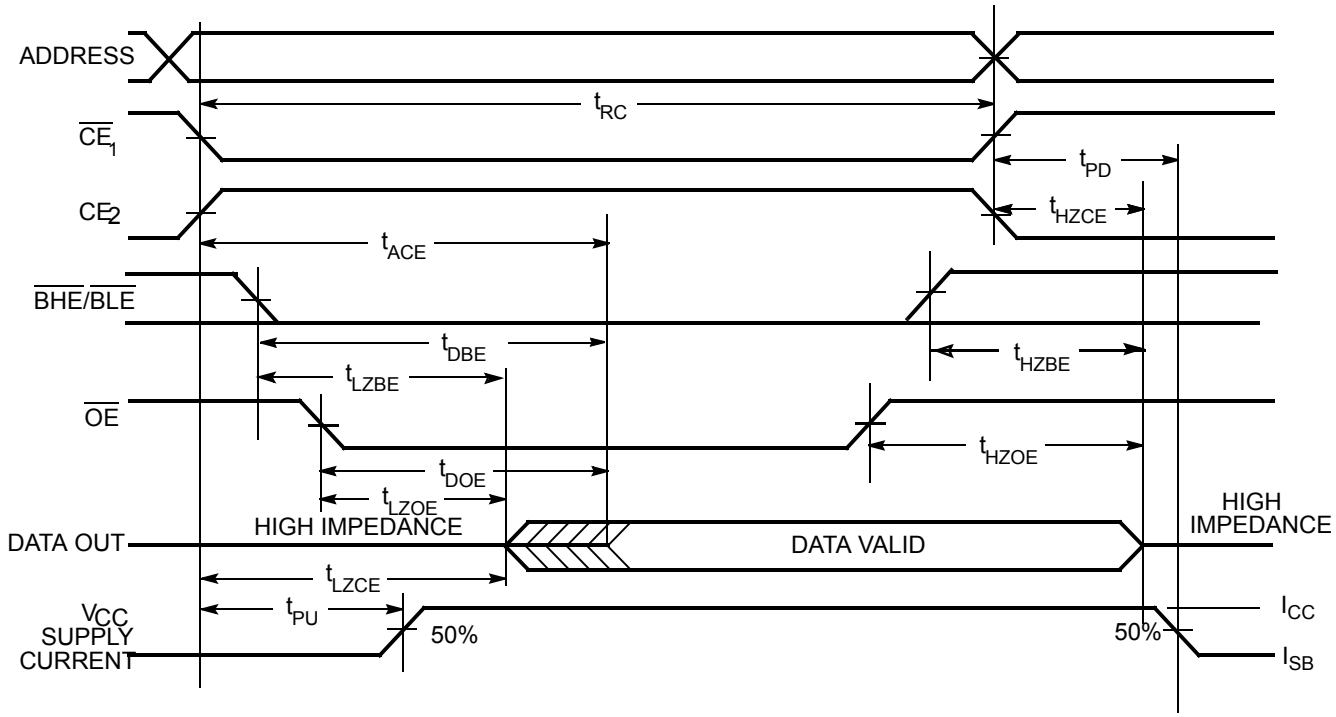
Notes:
14. Test conditions for all parameters other than three-state parameters assume signal transition time of 1 ns/V, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ.)}$, and output loading of the specified I_{OL}/I_{OH} as shown in the "AC Test Loads and Waveforms" section.
15. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, t_{HZBE} is less than t_{LZBE}, t_{HZOE} is less than t_{LZOE}, and t_{HZWE} is less than t_{LZWE} for any given device.
16. t_{HZOE}, t_{HZCE}, t_{HZBE}, and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
17. The internal Write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE}_1 = V_{IL}$, $\overline{BHE}$ and/or $\overline{BLE} = V_{IL}$, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input set-up and hold timing should be referenced to the edge of the signal that terminates the Write.

Switching Waveforms

Read Cycle 1 (Address Transition Controlled)[18, 19]



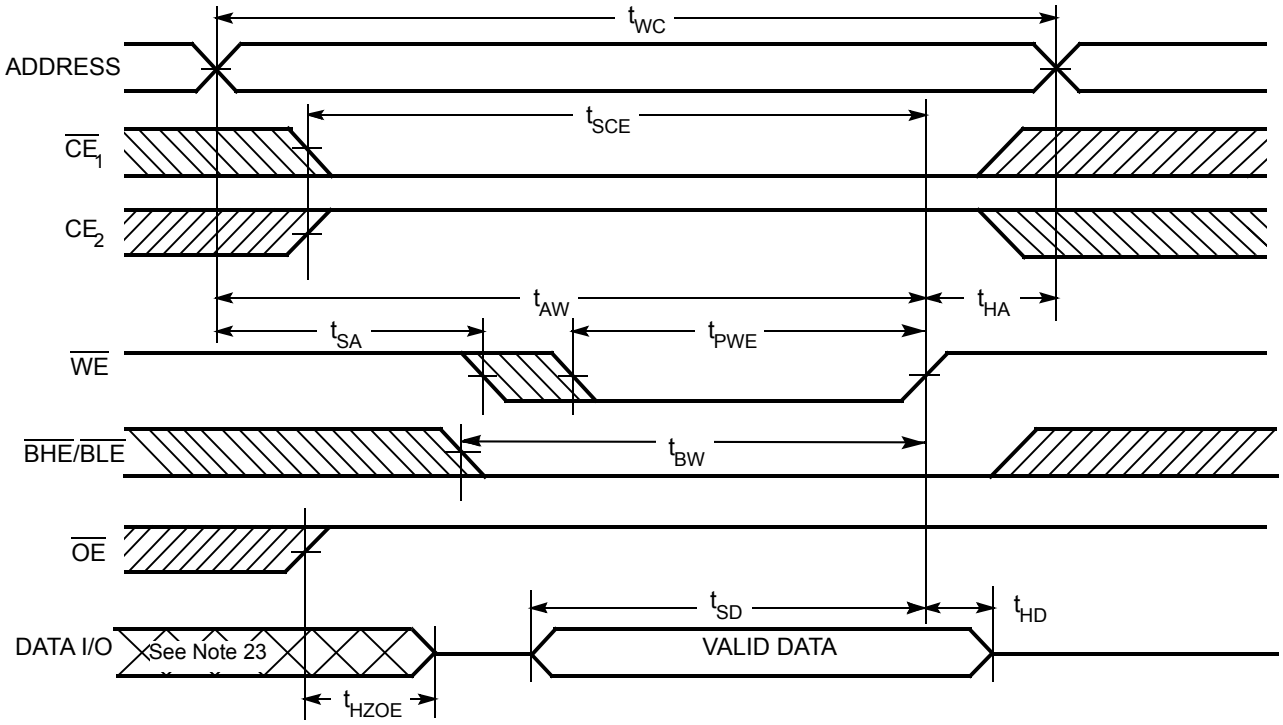
Read Cycle 2 ($\overline{OE}$ Controlled)[19, 20]



Notes:
18. The device is continuously selected. OE, $CE_1 = V_{IL}$, BHE and/or BLE = V_{IL}, and $CE_2 = V_{IH}$.
19. $\overline{WE}$ is HIGH for read cycle.

Switching Waveforms (continued)

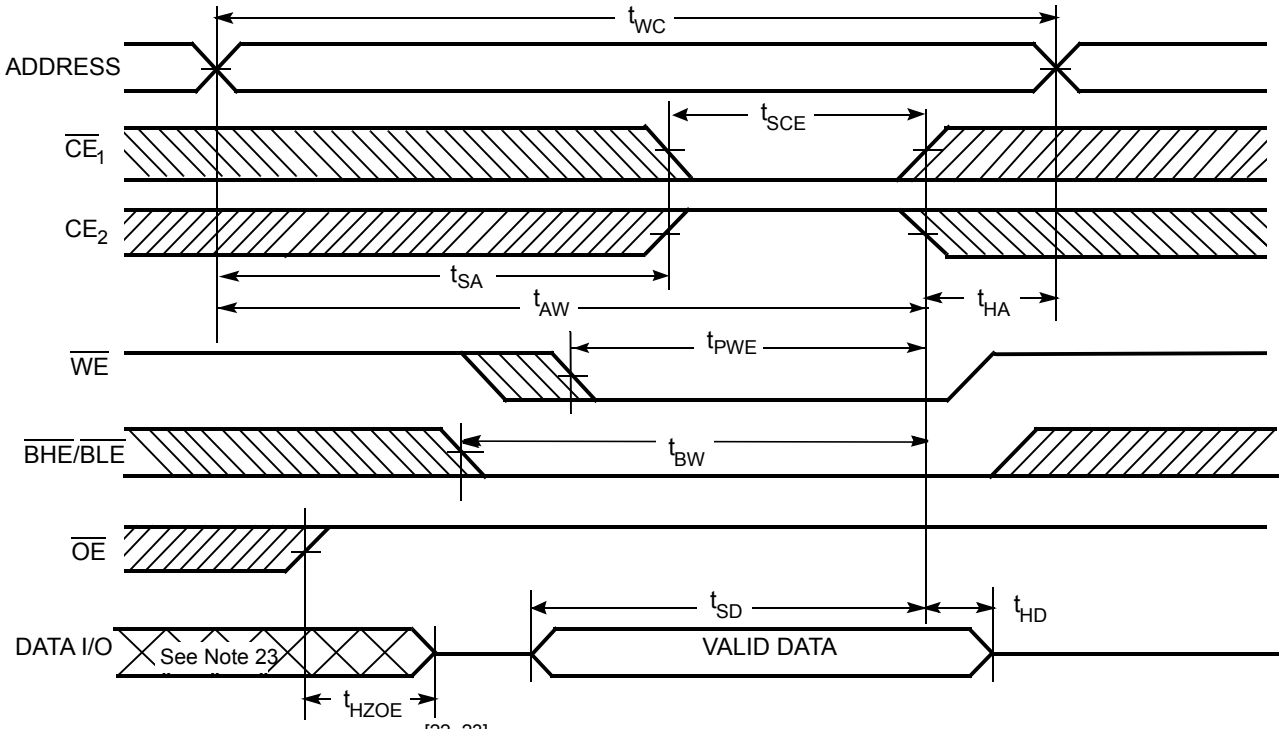
Write Cycle 1 ($\overline{WE}$ Controlled)[17, 21, 22, 23]



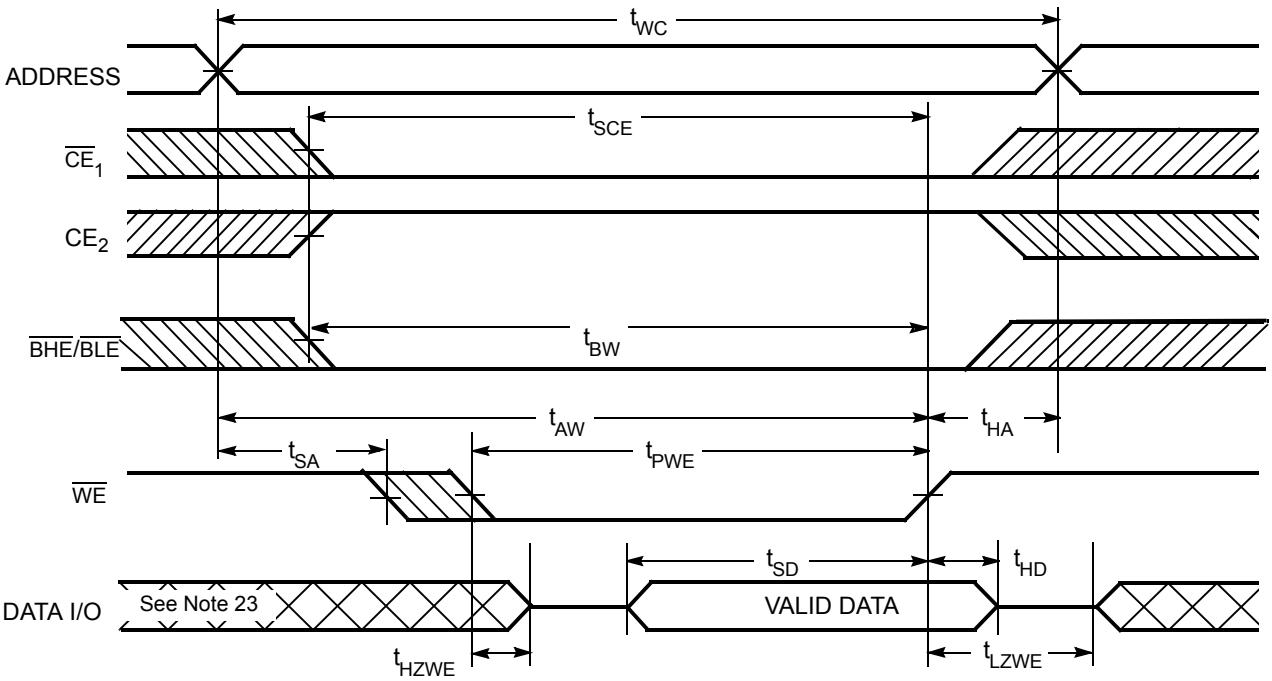
Notes:
20. Address valid prior to or coincident with $\overline{CE_1}$, $\overline{BHE}$, $\overline{BLE}$ transition LOW and CE_2 transition HIGH.
21. Data I/O is high-impedance if $\overline{OE}$ = V_{IH}.
22. If $\overline{CE_1}$ goes HIGH and CE_2 goes LOW simultaneously with $\overline{WE}$ = V_{IH}, the output remains in a high-impedance state.
23. During this period, the I/Os are in output state and input signals should not be applied.

Switching Waveforms (continued)

Write Cycle 2 ($\overline{CE}_1$ or CE_2 Controlled)[17, 21, 22, 23]



Write Cycle 3 (WE Controlled, OE LOW)[22, 23]



Switching Waveforms (continued)

Write Cycle 4 ($\overline{BHE}/\overline{BLE}$ Controlled, $\overline{OE}$ LOW)[22, 23]
