Functional Description

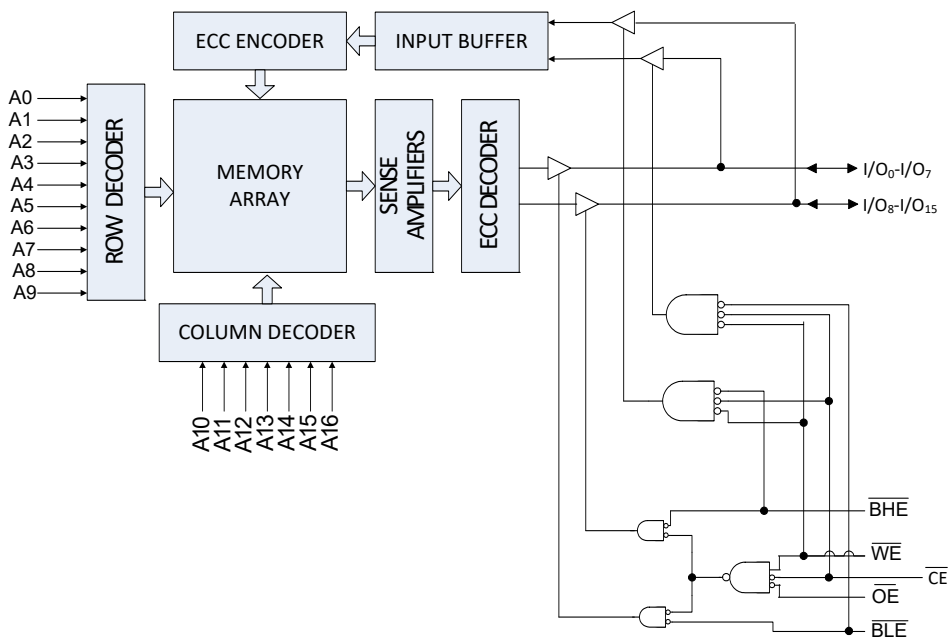

CY7C1011G is a high-performance CMOS fast static RAM automotive part with embedded ECC. This device has a single Chip Enable (\overline{CE}) input, and is accessed by asserting it LOW.

To perform data writes, assert the Write Enable (\overline{WE}) input LOW, and provide the data on the device data pins (I/O_0 through I/O_{15}) and address pins (A_0 through A_{16}) pins. The Byte High Enable (\overline{BHE}) and Byte Low Enable (\overline{BLE}) inputs control byte writes and write data on the corresponding I/O lines to the memory location specified. \overline{BHE} controls I/O_8 through I/O_{15} and \overline{BLE} controls I/O_0 through I/O_7 .

To perform data reads, assert the Output Enable (\overline{OE}) input and provide the required address on the address lines. You can access read data on the I/O lines (I/O_0 through I/O_{15}). To perform byte access, assert the required byte enable signal (\overline{BHE} or \overline{BLE}) to read either the upper byte or the lower byte of data from the specified address location.

All I/O s (I/O_0 through I/O_{15}) are placed in a high-impedance state when the device is deselected (\overline{CE} LOW), or when the control signals are deasserted (\overline{OE} , \overline{BLE} , \overline{BHE}).

Notes

- Test conditions assume a signal transition time (rise/fall) of 3 ns or less, timing reference levels of 1.5 V (for $V_{CC} \geq 3$ V) and $V_{CC}/2$ (for $V_{CC} < 3$ V), and input pulse levels of 0 to 3 V (for $V_{CC} \geq 3$ V) and 0 to V_{CC} (for $V_{CC} < 3$ V). Test conditions for the read cycle use output loading shown in part (a) of Figure 3 on page 5, unless specified otherwise.
- t_{HZOE} , t_{HZCE} , t_{HZWE} , t_{HZBE} , t_{LZOE} , t_{LZCE} , t_{LZWE} , and t_{LZBE} are specified with a load capacitance of 5 pF as in (b) of Figure 3 on page 5. Transition is measured ± 200 mV from steady state voltage.
- These parameters are guaranteed by design and are not tested.
- The internal write time of the memory is defined by the overlap of $\overline{WE} = V_{IL}$, $\overline{CE} = V_{IL}$ and \overline{BHE} or $\overline{BLE} = V_{IL}$. These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
- The minimum write cycle pulse width for Write Cycle No. 2 (\overline{WE} Controlled, \overline{OE} LOW) should be equal to sum of t_{SD} and t_{HZWE} .

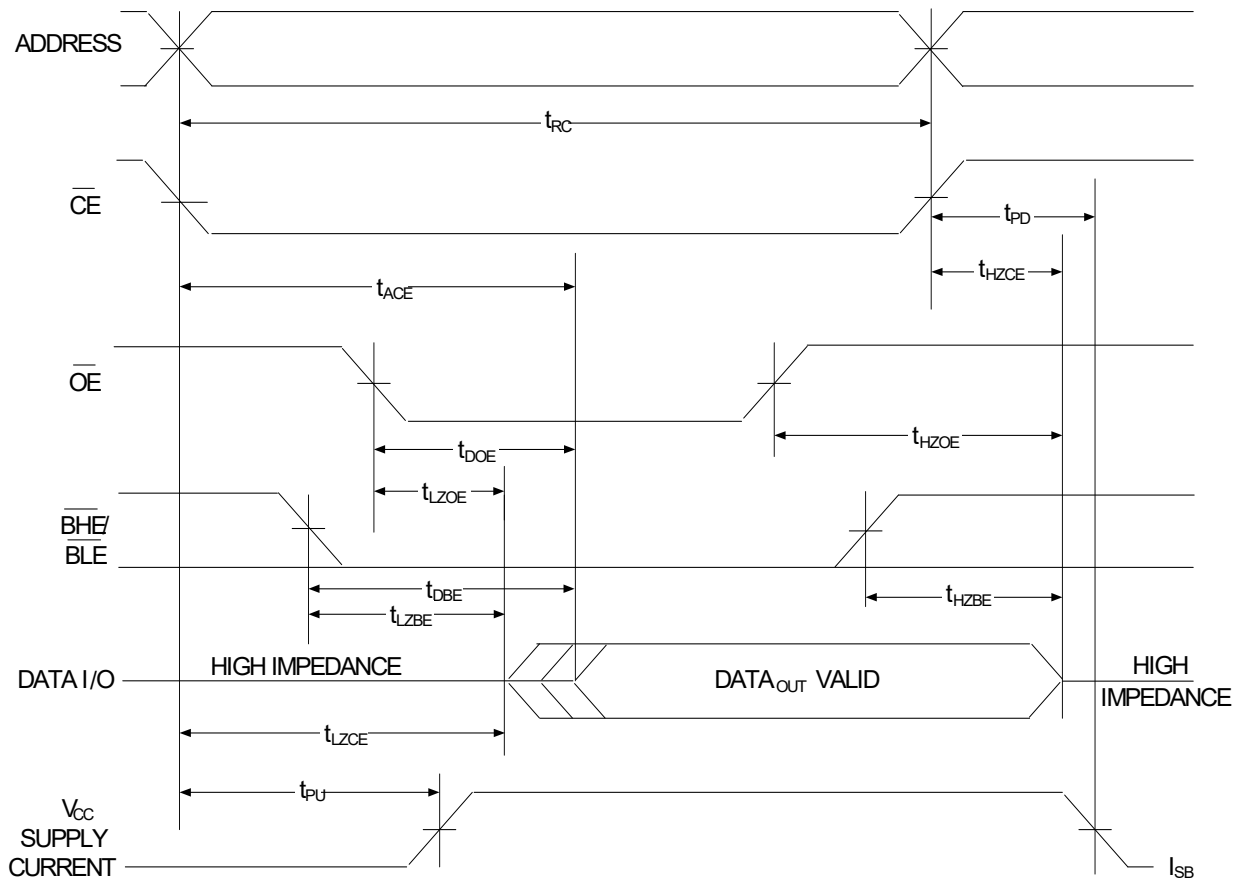

Figure 6. Read Cycle No. 2 (\overline{OE} Controlled) [16]

Notes

- 15. The device is continuously selected, $\overline{OE} = V_{IL}$, $\overline{CE} = V_{IL}$, \overline{BHE} or \overline{BLE} or both = V_{IL} .
- 16. \overline{WE} is HIGH for read cycle.

Notes

- 17. Address valid prior to or coincident with $\overline{\text{CE}}$ LOW transition.
- 18. The internal write time of the memory is defined by the overlap of $\overline{\text{WE}} = V_{IL}$, $\overline{\text{CE}} = V_{IL}$ and $\overline{\text{BHE}}$ or $\overline{\text{BLE}} = V_{IL}$. These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
- 19. Data I/O is in HI-Z state if $\overline{\text{CE}} = V_{IH}$, or $\overline{\text{OE}} = V_{IH}$ or $\overline{\text{BHE}}$, and/or $\overline{\text{BLE}} = V_{IH}$.
- 20. The minimum write cycle pulse width should be equal to sum of t_{SD} and t_{HZWE} .

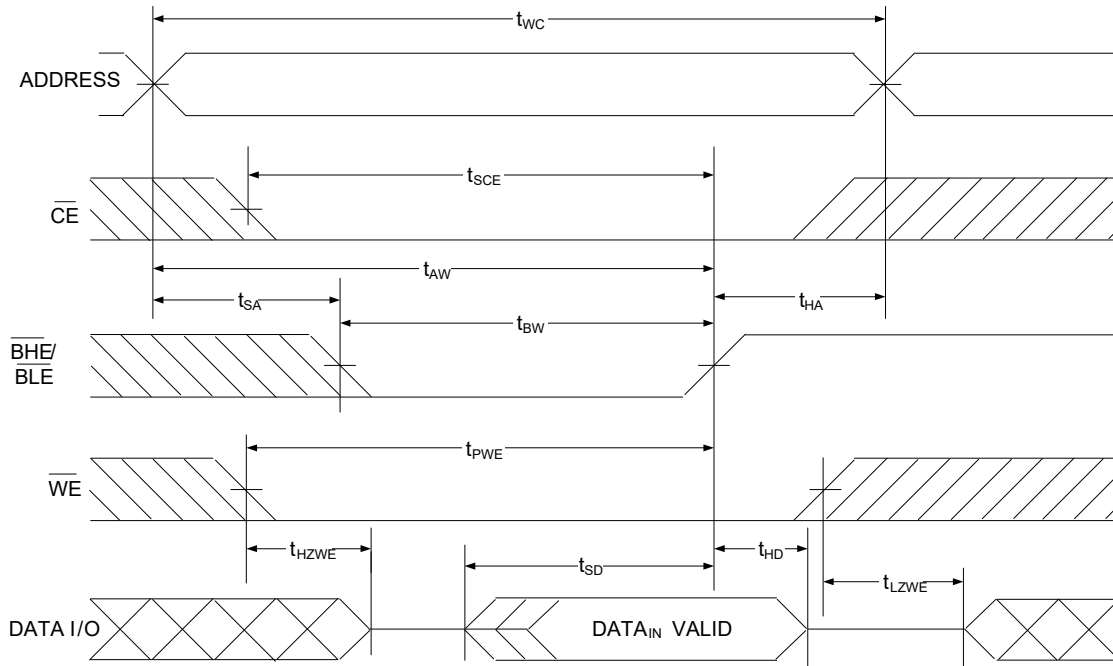

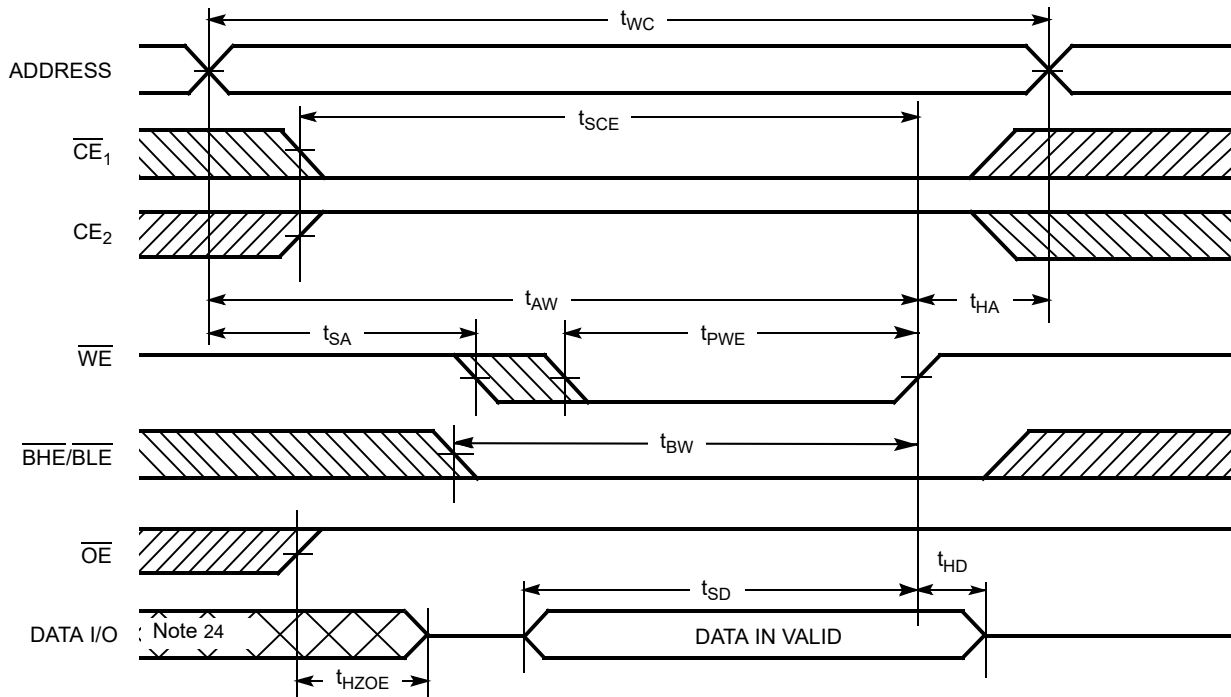

Figure 10. Write Cycle No. 4 ($\overline{\text{WE}}$ Controlled) [21, 22, 23]

Notes

- 21. The internal write time of the memory is defined by the overlap of $\overline{\text{WE}} = V_{\text{IL}}$, $\overline{\text{CE}} = V_{\text{IL}}$ and $\overline{\text{BHE}}$ or $\overline{\text{BLE}} = V_{\text{IL}}$. These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
- 22. Data I/O is in HI-Z state if $\overline{\text{CE}} = V_{\text{IH}}$, or $\overline{\text{OE}} = V_{\text{IH}}$ or $\overline{\text{BHE}}$, and/or $\overline{\text{BLE}} = V_{\text{IH}}$.
- 23. Data I/O is high impedance if $\overline{\text{OE}} = V_{\text{IH}}$.
- 24. During this period the I/Os are in output state. Do not apply input signals.
