

CY7C107
CY7C1007

1M x 1 Static RAM

Features

- **High speed**
— $t_{AA} = 12$ ns
- **CMOS for optimum speed/power**
- **Low active power**
— 825 mW
- **Low standby power**
— 275 mW
- **2.0V data retention (optional)**
— 100 μ W
- **Automatic power-down when deselected**
- **TTL-compatible inputs and outputs**

Functional Description

The CY7C107 and CY7C1007 are high-performance CMOS static RAMs organized as 1,048,576 words by 1 bit. Easy

memory expansion is provided by an active LOW Chip Enable (\overline{CE}) and three-state drivers. These devices have an automatic power-down feature that reduces power consumption by more than 65% when deselected.

Writing to the devices is accomplished by taking Chip Enable (\overline{CE}) and Write Enable (\overline{WE}) inputs LOW. Data on the input pin (D_{IN}) is written into the memory location specified on the address pins (A_0 through A_{19}).

Reading from the devices is accomplished by taking Chip Enable (\overline{CE}) LOW while Write Enable (\overline{WE}) remains HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the data output (D_{OUT}) pin.

The output pin (D_{OUT}) is placed in a high-impedance state when the device is deselected (\overline{CE} HIGH) or during a write operation (\overline{CE} and \overline{WE} LOW).

The CY7C107 is available in a standard 400-mil-wide SOJ; the CY7C1007 is available in a standard 300-mil-wide SOJ.

Notes:

- V_{IL} (min.) = -2.0V for pulse durations of less than 20 ns.
- T_A is the "instant on" case temperature.
- Not more than 1 output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.

Notes:

- Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} and t_{HZWE} is less than t_{LZWE} for any given device.
- t_{HZCE} and t_{HZWE} are specified with a load capacitance of 5 pF as in part (b) of AC Test Loads. Transition is measured ± 500 mV from steady-state voltage.
- The internal write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. \overline{CE} and \overline{WE} must be LOW to initiate a write, and the transition of any of these signals can terminate the write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the write.

Notes:

9. No input may exceed $V_{CC} + 0.5V$.
10. Device is continuously selected, $\overline{CE} = V_{IL}$.
11. \overline{WE} is HIGH for read cycle.
12. Address valid prior to or coincident with \overline{CE} transition LOW.
