

CYPRESS SEMICONDUCTOR

T-46-23-08

CY7C171  
CY7C172

4096 x 4 Static R/W RAM  
Separate I/O

Features

- Automatic power-down when deselected
- CMOS for optimum speed/power
- High speed  
—  $t_{AA} = 25$  ns
- Transparent Write (7C171)
- Low active power  
— 385 mW
- Low standby power  
— 83 mW
- TTL-compatible inputs and outputs
- Capable of withstanding greater than 2001V electrostatic discharge

Functional Description

The CY7C171 and CY7C172 are high-performance CMOS static RAMs organized as 4096 by 4 bits with separate I/O. Easy memory expansion is provided by an active LOW chip enable (CE) and three-state drivers. They have an automatic power-down feature, reducing the power consumption by 77% when deselected.

Writing to the device is accomplished when the chip enable (CE) and write enable (WE) inputs are both LOW. Data on the four input pins ( $I_0$  through  $I_3$ ) is written into the memory location specified on the address pins ( $A_0$  through  $A_{11}$ ).

Reading the device is accomplished by taking chip enable (CE) LOW, while write enable (WE) remains HIGH. Under these conditions, the contents of the memory location specified on the address pins will appear on the four data output pins ( $O_0$  through  $O_3$ ).

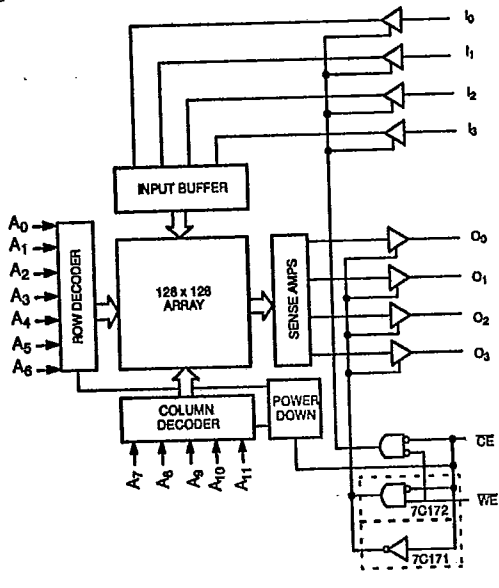

The output pins stay in high-impedance state when write enable (WE) is LOW (7C171 only), or chip enable (CE) is HIGH.

A die coat is used to insure alpha immunity.

**Maximum Ratings**

(Above which the useful life may be impaired. For user guidelines, not tested.)

- Storage Temperature ..... - 65°C to +150°C
- Ambient Temperature with Power Applied ..... - 55°C to +125°C
- Supply Voltage to Ground Potential (Pin 24 to Pin 12) ..... - 0.5V to +7.0V
- DC Voltage Applied to Outputs in High Z State ..... - 0.5V to +7.0V
- DC Input Voltage ..... - 3.0V to +7.0V
- Output Current into Outputs (Low) ..... 20 mA

- Static Discharge Voltage ..... >2001V (per MIL-STD-883, Method 3015)
- Latch-Up Current ..... >200 mA

**Operating Range**

Range	Ambient Temperature	V <sub>CC</sub>
Commercial	0°C to +70°C	5V ± 10%
Military <sup>[1]</sup>	- 55°C to +125°C	5V ± 10%

**Electrical Characteristics Over the Operating Range<sup>[2]</sup>**

**Capacitance<sup>[4]</sup>**

Parameters	Description	Test Conditions	Max.	Units
C <sub>IN</sub>	Input Capacitance	T <sub>A</sub> = 25°C, f = 1 MHz, V <sub>CC</sub> = 5.0V	10	pF
C <sub>OUT</sub>	Output Capacitance		10	pF

**Notes:**

1. T<sub>A</sub> is the "instant on" case temperature.
2. See the last page of this specification for Group A subgroup testing information.
3. Not more than 1 output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.
4. Tested initially and after any design or process changes that may affect these parameters

$t_{ADV}$	Data Valid to Output Valid (7C171)		25		30		35	ns

Notes:

- Test conditions assume signal transition times of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V and output loading of the specified  $I_{OL}/I_{OH}$ , and 30-pF load capacitance.
- At any given temperature and voltage condition,  $t_{HZ}$  is less than  $t_{LZ}$  for any given device.
- $t_{HZCE}$  and  $t_{HZWE}$  are tested with  $C_L = 5$  pF as in part (b) of AC Test Loads. Transition is measured  $\pm 500$  mV from steady state voltage.
- The internal write time of the memory is defined by the overlap of  $\overline{CE}$  LOW and  $\overline{WE}$  LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
- $\overline{WE}$  is HIGH for read cycle.
- Device is continuously selected,  $CE = V_{IL}$ .
