

## 8-BIT SINGLE-CHIP MICROCONTROLLER

## ★ DESCRIPTION

The  $\mu$ PD78011F, 78012F, 78013F, 78014F, 78015F, 78016F, and 78018F are the products in the  $\mu$ PD78018F subseries within the 78K/0 series.

Compared with the older  $\mu$ PD78014 subseries, this subseries operates at lower voltage and provides a fuller set of ROM and RAM variations.

A one-time PROM or EPROM product  $\mu$ PD78P018F capable of operating in the same power supply voltage range as of the mask ROM product and other development tools are also provided.

Functions are described in detail in the following User's Manual, which should be read when carrying out design work.

$\mu$ PD78018F, 78018FY Subseries User's Manual : U10659E  
78K/0 Series Users Manual – Instruction : U12326E

## FEATURES

- Large on-chip ROM & RAM

Item Product Name	Program Memory (ROM)	Data Memory			Package

$\mu$ PD78018F	60K bytes				

- ★ External memory expansion space : 64K bytes
- Minimum instruction execution time can be varied from high-speed (0.4  $\mu$ s) to ultra-low-speed (122  $\mu$ s)
- I/O ports: 53 (N-ch open-drain : 4)
- 8-bit resolution A/D converter : 8 channels
- Serial interface : 2 channels
- Timer : 5 channels
- Supply voltage :  $V_{DD} = 1.8$  to 5.5 V

## APPLICATION FIELDS

Cellular phone, pager, VCR, audio, camera, home appliances, etc

### 3. PIN FUNCTIONS

#### 3.1 PORT PINS (1/2)

Pin Name	I/O	Function		On Reset	Dual-Function Pin
P00	Input	Port 0 5-bit I/O port	Input only	Input	INTP0/TI0
P01	Input/ output		Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used in software.	Input	INTP1
P02					INTP2
P03					INTP3
P04 <sup>Note 1</sup>	Input		Input only	Input	XT1
P10 to P17	Input/ output	Port 1 8-bit input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used in software. <sup>Note 2</sup>		Input	ANI0 to ANI7
P20	Input/ output	Port 2 8-bit input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used in software.	Input	S11	
P21				SO1	
P22				$\overline{\text{SCK1}}$	
P23				STB	
P24				BUSY	
P25				SI0/SB0	
P26				SO0/SB1	
P27				$\overline{\text{SCK0}}$	
P30	Input/ output	Port 3 8-bit input/output port. Input/output can be specified in 1-bit units. When used as an input port, on-chip pull-up resistor can be used in software.	Input	TO0	
P31				TO1	
P32				TO2	
P33				TI1	
P34				TI2	
P35				PCL	
P36				BUZ	
P37				—	
P40 to P47	Input/ output	Port 4 8-bit input/output port. Input/output can be specified in 8-bit unit. When used as an input port, on-chip pull-up resistor can be used in software. Test input flag (KRIF) is set to 1 by falling edge detection.		Input	AD0 to AD7

**Notes 1.** When using the P04/XT1 pins as an input port, set 1 to bit 6 (FRC) of the processor clock control register (PCC). Do not use the on-chip feedback register of the subsystem clock oscillator.

**2.** When using the P10/ANI0 to P17/ANI7 pins as the A/D converter analog input, on-chip pull-up resistor is automatically unused.

3.1 PORT PINS (2/2)

Pin Name	I/O	Function		On Reset	Dual-Function Pin
P50 to P57	Input/output	Port 5 8-bit input/output port. LED can be driven directly. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used in software.		Input	A8 to A15
P60	Input/output	Port 6 8-bit input/output port. Input/output can be specified bit-wise.	N-ch open-drain input/output port. On-chip pull-up resistor can be specified by mask option. LED can be driven directly.	Input	—
P61					
P62					
P63					
P64		When used as an input port, on-chip pull-up resistor can be used in software.	$\overline{RD}$		
P65			$\overline{WR}$		
P66			$\overline{WAIT}$		
P67			ASTB		

3.2 PINS OTHER THAN PORT PINS (1/2)

Pin Name	I/O	Function		On Reset	Dual-Function Pin
INTP0	Input	External interrupt request input by which the effective edge (rising edge, falling edge, or both rising edge and falling edge) can be specified.		Input	P00/T10
INTP1					P01
INTP2		Falling edge detection external interrupt request input.			P02
INTP3					P03
SI0	Input	Serial interface serial data input.		Input	P25/SB0
SI1					P20
SO0	Output	Serial interface serial data output.		Input	P26/SB1
SO1					P21
SB0	Input/output	Serial interface serial data input/output.		Input	P25/SI0
SB1					P26/SO0
$\overline{SCK0}$	Input/output	Serial interface serial clock input/output.		Input	P27
$\overline{SCK1}$					P22
STB	Output	Serial interface automatic transmit/receive strobe output.		Input	P23
BUSY	Input	Serial interface automatic transmit/receive busy input.		Input	P24

## 3.2 PINS OTHER THAN PORT PINS (2/2)

Pin Name	I/O	Function	On Reset	Dual-Function Pin
T10	Input	External count clock input to 16-bit timer (TM0).	Input	P00/INTP0
T11		External count clock input to 8-bit timer (TM1).		P33
T12		External count clock input to 8-bit timer (TM2).		P34
TO0	Output	16-bit timer (TM0) output (shared as 14-bit PWM output).	Input	P30
TO1		8-bit timer (TM1) output.		P31
TO2		8-bit timer (TM2) output.		P32
PCL	Output	Clock output (for main system clock, subsystem clock trimming).	Input	P35
BUZ	Output	Buzzer output.	Input	P36
AD0 to AD7	Input /output	Low-order address/data bus at external memory expansion.	Input	P40 to P47
A8 to A15	Output	High-order address bus at external memory expansion.	Input	P50 to P57
$\overline{RD}$	Output	External memory read operation strobe signal output.	Input	P64
$\overline{WR}$		External memory write operation strobe signal output.		P65
$\overline{WAIT}$	Input	Wait insertion at external memory access.	Input	P66
ASTB	Output	Strobe output which latches the address information output at port 4 and port 5 to access external memory.	Input	P67
ANI0 to ANI7	Input	A/D converter analog input.	Input	P10 to P17
AVREF	Input	A/D converter reference voltage input.	—	—
AVDD	—	A/D converter analog power supply. Connected to V <sub>DD</sub> .	—	—
AVSS	—	A/D converter ground potential. Connected to V <sub>SS</sub> .	—	—
$\overline{RESET}$	Input	System reset input.	—	—
X1	Input	Main system clock oscillation crystal connection.	—	—
X2	—		—	—
XT1	Input	Subsystem clock oscillation crystal connection.	Input	P04
XT2	—		—	—
V <sub>DD</sub>	—	Positive power supply.	—	—
V <sub>SS</sub>	—	Ground potential.	—	—
IC	—	Internal connection. Connected to V <sub>SS</sub> directly.	—	—

**3.3 PIN I/O CIRCUITS AND RECOMMENDED CONNECTION OF UNUSED PINS**

The input/output circuit type of each pin and recommended connection of unused pins are shown in Table 3-1. For the input/output circuit configuration of each type, refer to **Figure 3-1**.

5. PERIPHERAL HARDWARE FUNCTION FEATURES

5.1 PORTS

The I/O port has the following three types

- CMOS input (P00, P04) : 2
  - CMOS input/output (P01 to P03, port 1 to port 5, P64 to P67) : 47
  - N-ch open-drain input/output(15V withstand voltage) (P60 to P63) : 4
- 
- Total : 53

Port 0	P00, P04	Dedicated Input port
	P01 to P03	Input/output ports. Input/output can be specified bit-wise. When used as an input port, pull-up resistor can be used in software.
Port 1	P10 to P17	Input/output ports. Input/output can be specified bit-wise. When used as an input port, pull-up resistor can be used in software.
Port 2	P20 to P27	Input/output ports. Input/output can be specified bit-wise. When used as an input port, pull-up resistor can be used in software.
Port 3	P30 to P37	Input/output ports. Input/output can be specified bit-wise. When used as an input port, pull-up resistor can be used in software.
Port 4	P40 to P47	Input/output ports. Input/output can be specified in 8-bit units. When used as an input port, pull-up resistor can be used in software. Test input flag (KRIF) is set to 1 by falling edge detection.
Port 5	P50 to P57	Input/output ports. Input/output can be specified bit-wise. When used as an input port, pull-up resistor can be used in software. LED can be driven directly.
Port 6	P60 to P63	N-ch open-drain input/output port. Input/output can be specified bit-wise. On-chip pull-up resistor can be specified by mask option. LED can be driven directly.
	P64 to P67	Input/output ports. Input/output can be specified bit-wise. When used as an input port, pull-up resistor can be used in software.

5.2 CLOCK GENERATOR

There are two types of clock generator: main system clock and subsystem clock.  
The minimum instruction execution time can be changed.

- 0.4 $\mu$ s/0.8 $\mu$ s/1.6 $\mu$ s/3.2 $\mu$ s/6.4 $\mu$ s (Main system clock: at 10.0 MHz operation)
- 122 $\mu$ s (Subsystem clock: at 32.768 KHz operation)

### 5.3 TIMER/EVENT COUNTER

The following five channels are incorporated in the timer/event counter.

- 16-bit timer/event counter : 1 channel
- 8-bit timer/event counter : 2 channels
- Watch timer : 1 channel
- Watchdog timer : 1 channel

**Table 5-2. Operation of Timer/Event Counter**

**5.4 CLOCK OUTPUT CONTROL CIRCUIT**

The clock with the following frequencies can be output for clock output.

- 39.1 kHz/78.1 kHz/156 kHz/313 kHz/625 kHz/1.25 MHz (Main system clock: at 10.0 MHz operation)
- 32.768 kHz (Subsystem clock: at 32.768 kHz operation)

5.6 A/D CONVERTER

The A/D converter has on-chip eight 8-bit resolution channels. There are the following two method to start A/D conversion.

- Hardware starting
- Software starting

Figure 5-8. A/D Converter Block Diagram

5.7 SERIAL INTERFACES

There are two on-chip clocked serial interfaces as follows.

- Serial Interface channel 0
- Serial Interface channel 1

Table 5-3. Type and Function of Serial Interface

Function	Serial Interface Channel 0	Serial Interface Channel 1
3-wire serial I/O mode	O (MSB/LSB-first switchable)	O (MSB/LSB-first switchable)

6. INTERRUPT FUNCTIONS AND TEST FUNCTIONS

6.1 INTERRUPT FUNCTIONS

There are interrupt functions, 14 sources of three different kinds, as shown below.

- Non-maskable : 1
- Maskable : 12
- Software : 1

Table 6-1. Interrupt Source List

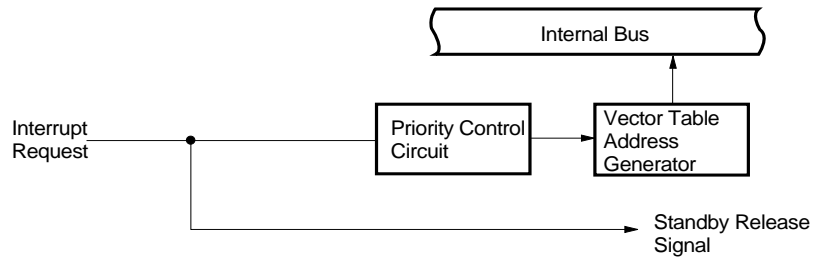

Interrupt Type	Default Priority <sup>Note 1</sup>	Interrupt Source		Internal/ External	Vector Table Address	Basic Configuration Type <sup>Note 2</sup>		
		Name	Trigger					
Non-maskable	—	INTWDT	Watchdog timer overflow (with watchdog timer mode 1 selected)	Internal	0004H	(A)		
Maskable	0	INTWDT	Watchdog timer overflow (with interval timer mode selected)			External	0006H 0008H 000AH 000CH	(B)
	1	INTP0	Pin input edge detection	Internal	000EH 0010H 0012H 0014H 0016H 0018H 001AH			(C)
	2	INTP1						(D)
	3	INTP2						(B)
	4	INTP3						(B)
	5	INTCSI0	Serial interface channel 0 transfer end	Internal	000EH 0010H 0012H 0014H 0016H 0018H 001AH	(B)		
	6	INTCSI1	Serial interface channel 1 transfer end			(B)		
	7	INTTM3	Reference time interval signal from watch timer			(B)		
	8	INTTM0	16 bit timer/event counter match signal generation			(B)		
	9	INTTM1	8-bit timer/event counter 1 match signal generation			(B)		
	10	INTTM2	8-bit timer/event counter 2 match signal generation			(B)		
	11	INTAD	A/D converter conversion end			(B)		
Software	—	BRK	BRK instruction execution	—	003EH	(E)		

**Notes 1.** The default priority is the priority applicable when more than one maskable interrupt request is generated. 0 is the highest priority and 11, the lowest.

**2.** Basic configuration types (A) to (E) correspond to (A) to (E) on the next page.

### 7. EXTERNAL DEVICE EXPANSION FUNCTIONS

The external device expansion function is used to connect external devices to areas other than the internal ROM, RAM and SFR.

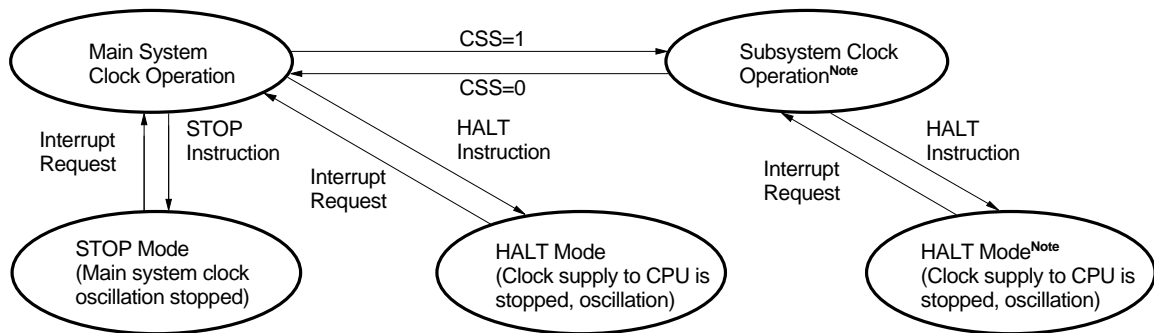

Ports 4 to 6 are used for connection with external devices.

### 8. STANDBY FUNCTIONS

There are the following two standby functions to reduce the current dissipation.

- HALT mode : The CPU operating clock is stopped. The average consumption current can be reduced by intermittent operation in combination with the normal operating mode.
- STOP mode : The main system clock oscillation is stopped. The whole operation by the main system clock is stopped, so that the system operates with ultra-low power consumption using only the subsystem clock.

Figure 8-1. Standby Functions

**Note** The power consumption can be reduced by stopping the main system clock. When the CPU is operating on the subsystem clock, set the bit 7 (MCC) of the processor clock control register (PCC) to stop the main system clock. The STOP instruction cannot be used.

**Caution** When the main system clock is stopped and the system is operated by the subsystem clock, the subsystem clock should be switched again to the main system clock after the oscillation stabilization time is secured by the program by the program.

### 9. RESET FUNCTIONS

There are the following two reset methods.

- External reset input by  $\overline{RESET}$  pin.
- Internal reset by watchdog timer runaway time detection.

10. INSTRUCTION SET

(1) 8-Bit Instruction

			rms	20	mA
Operating ambient temperature	$T_A$			-40 to +85	$^\circ\text{C}$
Storage temperature	$T_{stg}$			-65 to +150	$^\circ\text{C}$

**Note** rms should be calculated as follows:  $[\text{rms}] = [\text{peak value}] \times \sqrt{\text{duty}}$

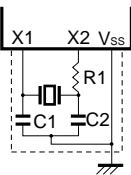

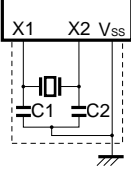

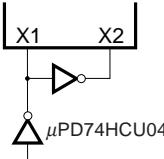

**Caution** Product quality may suffer if the absolute maximum rating is exceeded for even a single parameter or even momentarily. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions which ensure that the absolute maximum ratings are not exceeded.

Capacitance (  $T_A = 25\text{ }^\circ\text{C}$ ,  $V_{DD} = V_{SS} = 0\text{ V}$  )

		X1 input high/low level width ( $t_{xH}$ , $t_{xL}$ )		45		500	ns

**Notes 1.** Indicates only oscillation circuit characteristics. Refer to **AC Characteristics** for instruction execution time.

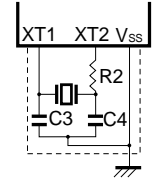

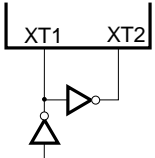

**2.** Time required to stabilize oscillation after reset or STOP mode release.

**Cautions 1.** When using the main system clock oscillator, wiring the area enclosed with the dotted line should be carried out as follows to avoid an adverse effect from wiring capacitance.

- Wiring should be as short as possible.
- Wiring should not cross other signal lines.
- Wiring should not be placed close to a varying high current.
- The potential of the oscillator capacitor ground should be the same as  $V_{SS}$ .
- Do not ground wiring to a ground pattern in which a high current flows.
- Do not fetch a signal from the oscillator.

**2.** When the main system clock is stopped and the system is operated by the subsystem clock, the subsystem clock should be switched again to the main system clock after the oscillation stabilization time is secured by the program.

**Subsystem Clock Oscillation Circuit Characteristics** ( $T_A = -40$  to  $+85$  °C,  $V_{DD} = 1.8$  to  $5.5$  V)

Resonator	Recommended Circuit	Parameter	Test Conditions	MIN.	TYP.	MAX.	Unit
Crystal resonator		Oscillator frequency ( $f_{XT}$ ) <b>Note 1</b>		32	32.768	35	kHz
		Oscillation stabilization time <b>Note 2</b>	$V_{DD} = 4.5$ to $5.5$ V		1.2	2	s
External clock		XT1 input frequency ( $f_{XT}$ ) <b>Note 1</b>		32		100	
		XT1 input high/low level width ( $t_{XTH}$ , $t_{XTL}$ )		5		15	μs

**Notes 1.** Indicates only oscillation circuit characteristics. Refer to **AC Characteristics** for instruction execution time.

**2.** Time required to stabilize oscillation after  $V_{DD}$  reaches oscillator voltage MIN.

**Cautions 1.** When using the subsystem clock oscillator, wiring in the area enclosed with the dotted line should be carried out as follows to avoid an adverse effect from wiring capacitance.

- Wiring should be as short as possible.
- Wiring should not cross other signal lines.
- Wiring should not be placed close to a varying high current.
- The potential of the oscillator capacitor ground should be the same as  $V_{SS}$ .
- Do not ground wiring to a ground pattern in which a high current flows.
- Do not fetch a signal from the oscillator.

**2.** The subsystem clock oscillation circuit is a circuit with a low amplification level, more prone to misoperation due to noise than the main system clock.

Particular care is therefore required with the wiring method when the subsystem clock is used.

★ Recommended Oscillation Circuit Constant

Recommended oscillation circuit constant differs depending on the model.

**Caution** The oscillation circuit constants and oscillation voltage range indicate conditions for stable oscillation but do not guarantee the accuracy of the oscillation frequency. If the application circuit requires accuracy of the oscillation frequency, it is necessary to set the oscillation frequency of the resonator in the application circuit. For this, it is necessary to directly contact manufacturer of the resonator being used.

## NOTES FOR CMOS DEVICES

### ① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

**Note:** Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

### ② HANDLING OF UNUSED INPUT PINS FOR CMOS

**Note:** No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to  $V_{DD}$  or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

### ③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

**Note:** Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

## Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

The export of this product from Japan is regulated by the Japanese government. To export this product may be prohibited without governmental license, the need for which must be judged by the customer. The export or re-export of this product from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

**Standard:** Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

**Special:** Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

**Specific:** Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
