

T-49-19-08

**Description**

The μPD78310 and μPD78312 microcomputers are designed for use in process control. They perform all the usual process control functions and are particularly well-suited for driving dc motors in servo loops and stepping motors. The processor includes on-chip memory, timers, input/output registers, and a powerful interrupt handling facility. The μPD78310/312 is constructed of high-speed CMOS circuitry and operates from a +5 V power supply.

The input frequency (maximum 12 MHz) is derived from an external crystal or an external oscillator. The internal processor clock is two-phase, and thus machine states are executed at a rate of 6 MHz. The shortest instructions require three states, making the minimum time 500 ns. The CPU contains a three-byte instruction prefetch queue which allows a subsequent instruction to be fetched during execution of an instruction that does not reference memory.

Program memory is 8K bytes of mask-programmable ROM (μPD78312 only), and data memory is 256 bytes of static RAM. The μPD78310 is the ROM-less version.

**Note:** μPD78P312, available in 3Q86, is a prototyping chip for μPD78312. It has an on-chip 8K EPROM instead of a mask ROM.

**Features**

- Complete single-chip microcomputer
  - 16-bit ALU
  - 8K ROM (μPD78312 only)
  - 256 bytes RAM
  - 1-bit and 8-bit logic
- Instruction prefetch queue
- 16-bit unsigned multiply and divide
- String instructions
- Memory expansion
- 8085A bus-compatible
  - Total 64K address space
- Large I/O capacity
  - Up to 32 I/O port lines
- Extensive timer/counter system
  - Two 16-bit up/down counters
  - Two 16-bit timers
  - Free running counter with two 16-bit capture registers
  - Pulse-width modulated outputs
  - Timebase counter
- Four-channel 8-bit A/D converter
- Two 4-bit real-time output ports
- Two nonmaskable interrupts
- Eight hardware priority interrupt levels

- Macro service facility for interrupts
  - Gives the effect of 8 DMA channels
- Bidirectional serial port
  - Either UART or interface mode
  - Dedicated baud rate generator
- Watchdog timer
- Refresh output for pseudostatic RAM
- Programmable HALT and STOP modes
- One-byte call instruction
- On-chip clock generator
- CMOS silicon gate technology
- +5 V power supply

**Pin Configurations**

RESET	External reset input
RD	Read strobe output
WR	Write strobe output
ALE	Address latch enable output
P4 <sub>0</sub> -P4 <sub>7</sub> /AD <sub>0</sub> -AD <sub>7</sub>	I/O port 4/External address/Data bus
VDD	Power supply

**Pin Functions**

**P0<sub>0</sub>-P0<sub>7</sub> [Port 0]**

Port 0 consists of 8 bits, individually programmable for input/output or two 4-bit real-time (timer controlled) output ports.

**P1<sub>0</sub>-P1<sub>7</sub> [Port 1]**

Port 1 consists of 8 bits, individually programmable for input/output.

**P2<sub>0</sub>/NMI**

Port P2<sub>0</sub> is dedicated to NMI, the nonmaskable external interrupt request.

**P2<sub>1</sub>-P2<sub>3</sub>/INTE0-INTE2**

Ports P2<sub>1</sub>-P2<sub>3</sub> are dedicated to INTE0, INTE1, and INTE2, the maskable external interrupt requests.

7-49-19-08

### P2<sub>4</sub>/TxD

P2<sub>4</sub> is an I/O port bit or the transmitted serial data output.

### P2<sub>5</sub>/RxD

P2<sub>5</sub> is an I/O port bit or the received serial data input.

### P2<sub>6</sub>/SCK

P2<sub>6</sub> is an I/O port bit or the serial shift clock output.

### P2<sub>7</sub>/CTS

P2<sub>7</sub> is an I/O port bit or clear-to-send input (external serial transmission control) in the asynchronous communication mode. In the serial I/O interface mode, it becomes the serial receive clock I/O pin.

### RFSH

RFSH is the refresh pulse output to be used for external pseudostatic DRAM.

### P3<sub>0</sub>/CI0

Port P3<sub>0</sub> is dedicated to CI0, the external count input for up/down counter 0.

### P3<sub>1</sub>/CTRL0

Port P3<sub>1</sub> is dedicated to CTRL0, the external control input for up/down counter 0.

### P3<sub>2</sub>/CI1

Port P3<sub>2</sub> is dedicated to CI1, the external count input for up/down counter 1.

### P3<sub>3</sub>/CTRL1

Port P3<sub>3</sub> is dedicated to CTRL1, the external control input for up/down counter 1.

### X1

X1 is the external oscillator input or one of the connections for an external crystal. It is used to generate the system clock. The system clock frequency is half the input frequency.

### X2

X2 is the second connection for an external crystal.

### V<sub>SS</sub>

V<sub>SS</sub> is the power supply return, normally ground.

### AN<sub>0</sub>-AN<sub>3</sub>

AN<sub>0</sub>-AN<sub>3</sub> are the four program selectable input channels for the A/D converter.

### AV<sub>REF</sub>

AV<sub>REF</sub> is the reference voltage input for the A/D converter.

### AV<sub>SS</sub>

AV<sub>SS</sub> is the analog ground pin.

### P3<sub>4</sub>/PWM0

P3<sub>4</sub> is an I/O port bit or the pulse-width modulated output 0.

### P3<sub>5</sub>/PWM1

P3<sub>5</sub> is an I/O port bit or the pulse-width modulated output 1.

### P3<sub>6</sub>/CLR0/TO0

P3<sub>6</sub> is an I/O port bit, or the clear input for up/down counter 0, or the timer 0 flip-flop output.

### P3<sub>7</sub>/CLR1/TO1

P3<sub>7</sub> is an I/O port bit, or the clear input for up/down counter 1, or the timer 1 flip-flop output.

### P5<sub>0</sub>-P5<sub>7</sub>/A<sub>8</sub>-A<sub>15</sub> [Port 5]

Port 5 consists of 8 bits, individually programmable for input or output, or the high-order address bits for external memory. Under control of the memory mask register, bits P5<sub>0</sub>-P5<sub>3</sub> are used for 4K memory expansion, bits P5<sub>0</sub>-P5<sub>5</sub> are used for 16K memory expansion, or bits P5<sub>0</sub>-P5<sub>7</sub> are used for 56K memory expansion.

### $\overline{EA}$ [External Access]

On  $\mu$ PD78312, a low on  $\overline{EA}$  enables use of external memory in place of on-chip ROM. The  $\overline{EA}$  pin must be low on  $\mu$ PD78310.

### $\overline{RESET}$

This pin is used for the external reset input. A low level sets all registers to their specified reset values.

### $\overline{RD}$

$\overline{RD}$  is the read strobe output. It is to be used by external memory (or data registers) to place data on the I/O bus during a read operation.

4

**WR**

WR is the write strobe output. It is to be used by external memory (or data registers) to latch data from the I/O bus during a write operation.

**ALE**

ALE is the address latch enable. It is to be used by external circuitry to latch the low-order 8 address bits during the first part of a read or write cycle.

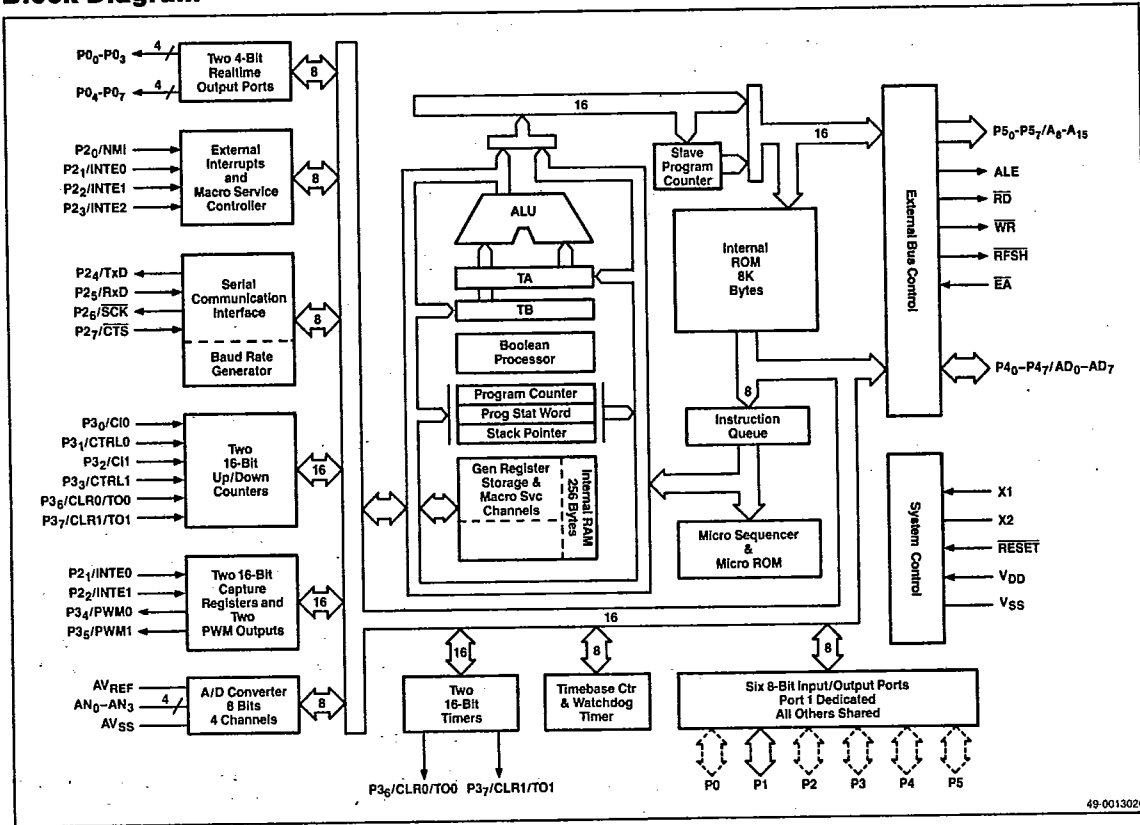

**P40-P47/AD0-AD7 [Port 4]**

Port 4 consists of 8 bits, programmable as a unit for input or output, or as the multiplexed address/data bus if external memory or external interface circuitry is used. The port is controlled by the memory mapping register.

**VDD**

VDD is the positive power supply input.

**Block Diagram**

T-49-19-08

### Functional Description

On-chip features designed to facilitate process control include two 16-bit timers, two 16-bit up/down counters, two pulse-width modulated outputs, a free-running counter with two capture registers, two 4-bit real-time (timer controlled) output ports, an 8-bit A/D converter with 4 input channels, a timebase counter to generate widely spaced interrupts, and a watchdog timer to guard against infinite program loops.

In addition there is a serial I/O port which can be used in either an interface mode or an asynchronous communication mode. HALT and STOP modes are provided to conserve power at times when the action of the CPU is not required.

All I/O, timer, and control registers are defined as special function registers and assigned addresses in the top 256 bytes of memory. The special function registers may be operated on directly by many of the arithmetic, logic, and move instructions of the CPU. Table 2 at the end of the Functional Description describes the registers.

### Addressing

The μPD78310/312 features 1-byte addressing of the special function registers and 1-byte addressing of the internal RAM. There are nine modes of addressing main memory, including autoincrement, autodecrement, indexing, and double indexing. There are 8- and 16-bit immediate operands.

### External Memory

External memory (figure 1) is supported by I/O port 4, an 8-bit multiplexed address/data bus. The memory mapping register controls the size of external memory as well as the number of additional wait states. High-order address bits are taken from I/O port 5 as required. No bits are required for 256 bytes of external memory; bits P5<sub>0</sub>-P5<sub>3</sub> are used for 4K bytes, P5<sub>0</sub>-P5<sub>5</sub> for 16K bytes, and P5<sub>0</sub>-P5<sub>7</sub> for 56K bytes. Any remaining port 5 bits are available for I/O.

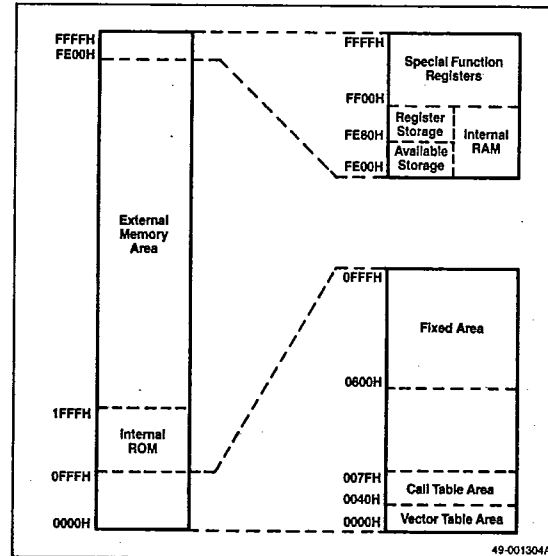

### Refresh

The μPD78310/312 has a refresh signal for use with the pseudostatic RAM. The refresh cycle can be set to one of four intervals ranging from 2.67 to 21.3 μs. The refresh is timed to follow a read or write operation so that the CPU does not have to wait.

### General Registers

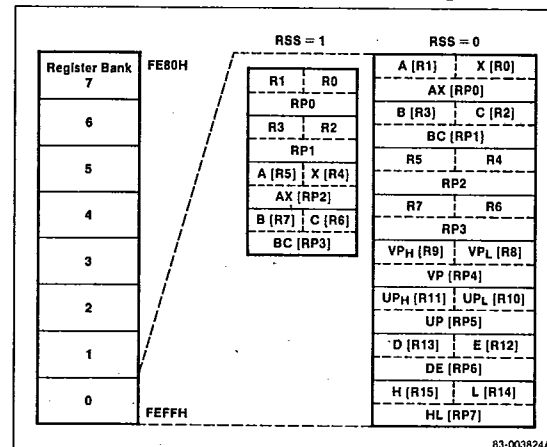

The CPU has 16 8-bit registers (figure 2) that can also be used in pairs to function as 16-bit registers. A complete set of 16 general registers is mapped into each of 8 program-selectable register banks, stored in RAM. Three bits in the PSW specify which of the register banks is active at any given time. Each register bank has two program-selectable accumulators.

Figure 1. Memory Map

4

Figure 2. Register Designation and Storage

**μPD78310/312**

T-49-19-08

**Program Status Word**

Following is the program status word format.

- RB<sub>2</sub>-RB<sub>0</sub> Active register bank number
- IE Interrupt enable
- S Sign (1 if last result was negative)
- Z Zero (1 if last result was zero)
- RSS Register set select
- AC Auxiliary carry (carry out of 3 bit)
- UF User flag
- P/V Parity or arithmetic overflow
- SUB Subtract (1 if last operation was subtract)
- CY Carry

**Input/Output**

All ports may be used for either latched output or high-impedance input. All ports except port 4 are bit-programmable for input or output. Port 0 is used for real-time or normal I/O. Port 1 is used for normal I/O. The low nibble of ports 2 and 3 is always used for control and the high nibble for control or normal I/O. Port 4 is used for the external address/data bus or byte-programmable I/O. Port 5 is used for the high bits of the external address or for normal I/O.

**Real-Time Output Port**

The real-time output port shares pins with I/O port 0. The high and low nibbles are treated separately or together. Data is transferred from a buffer to the port latches on either a timer or software command.

**Serial Port**

The serial port can operate in UART or interface mode with the baud rate and byte format under program control. The serial port also includes a dedicated baud rate generator.

**Pulse-Width Modulated Outputs**

The two independent pulse-width modulated outputs are controlled by two 16-bit modulus registers and counters. There are four programmable repetition rates ranging from 91.6 Hz to 23.4 kHz. Figure 3 shows one of these outputs.

**Figure 3. Pulse-Width Modulated Output**

**Timers**

The μPD78310/312 has two 16-bit timers. The inputs to these timers may be the internal clock divided by 6 or by 128. Each timer has an associated modulus register to store the timer count. The timer counts down to zero, sets a flag, reloads from the modulus register, and then counts down again. The timer flags can be used under program control to generate interrupt requests and/or a square-wave output. TM0 also functions optionally as two one-shot timers.

Figure 4 is a diagram of the interval timers.

There is a free-running counter that counts the internal clock divided by 4 or by 16. The counter has two 16-bit capture registers. Capture is triggered by an external interrupt request or by the up/down counter clock.

The timebase counter generates a signal at one of four intervals ranging from 170 μs to 175 ms. The signal can be used to generate an interrupt request and/or an up/down counter capture.

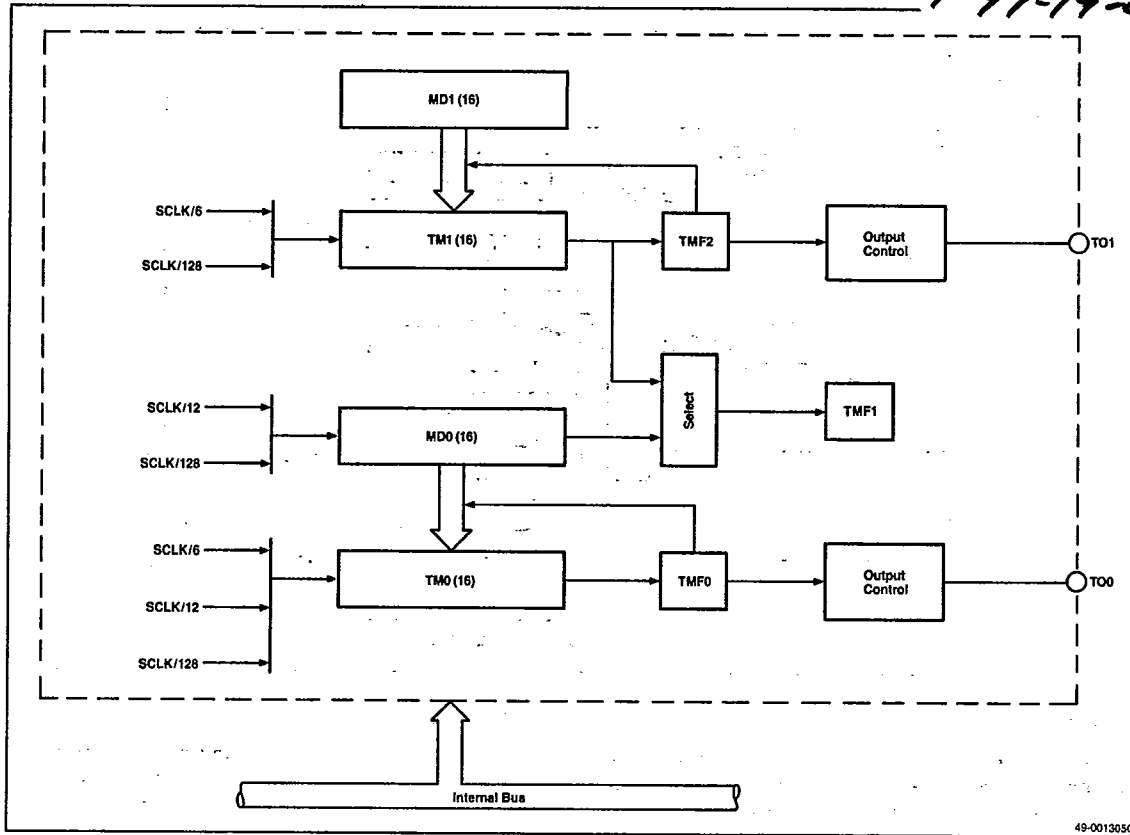

**Up/Down Counters**

The μPD78310/312 has two 16-bit up/down counters, each of which has two capture/compare registers. There are three modes of operation: compare and interrupt, capture on external command, and capture on timebase counter command. There are five sources of counts: the internal clock divided by 3, the external clock, external independent up and down inputs, external clock with direction control, and external clock with automatic up/down discrimination. Figure 5 shows an up/down counter.

Figure 4. Timer Block Diagram

T-49-19-08

**Standby Modes**

HALT and STOP modes conserve power when CPU action is not required. In HALT mode, the CPU stops and the clock continues to run. Maskable interrupts can restart the CPU.

In STOP mode, the CPU and clock are both stopped. A RESET pulse or the nonmaskable external interrupt is required to restart them.

There is also the option of slowing the system clock by a factor of four. The standby control register controls the standby modes and is a protected location written to only by a special instruction.

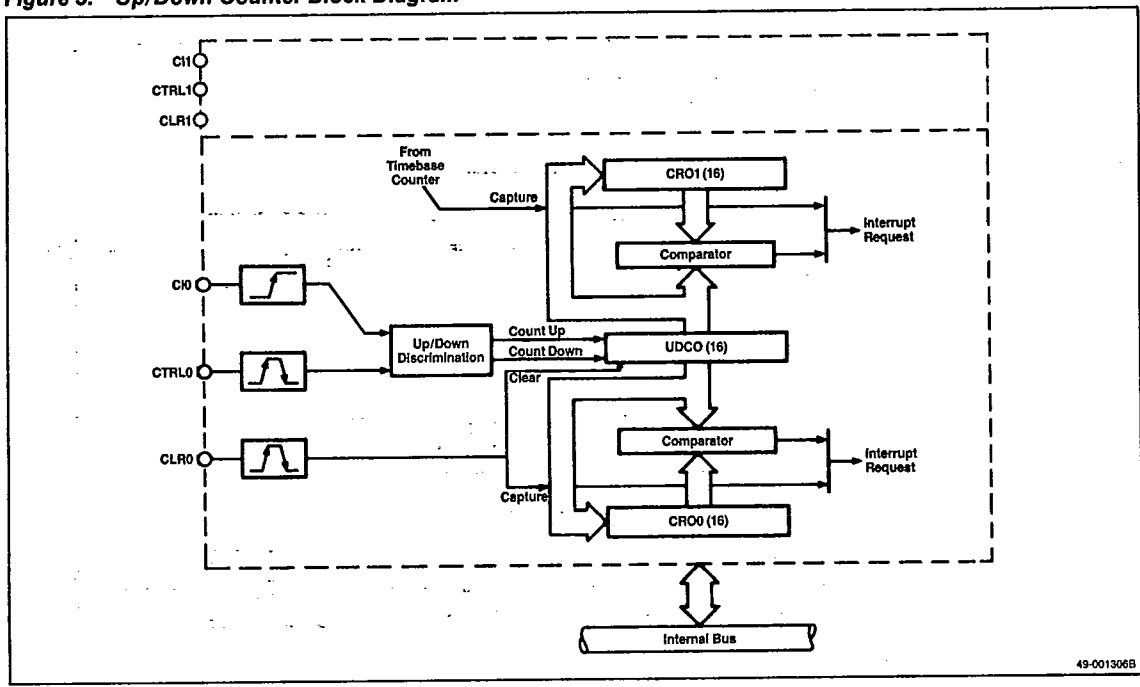

**Watchdog Timer**

The watchdog timer protects against inadvertent program loops. A nonmaskable interrupt occurs if the timer is not reset before a timeout occurs. There are four program-selectable intervals ranging from 5.5 ms to 349.3 ms. The watchdog timer can be disabled by software. The watchdog timer mode register controls the watchdog timer and is a protected location written to by a special instruction.

**A/D Converter**

The A/D converter has four input channels and can operate in either scan or select mode. The A/D converter performs 8-bit successive approximation conversions, has a 30-μs conversion time, and is triggered either internally or externally. The A/D converter includes an on-chip sample and hold amplifier.

Figure 5. Up/Down Counter Block Diagram

**Interrupts**

There are two nonmaskable interrupt sources: the external nonmaskable interrupt and the watchdog timer. Their relative priorities are software selectable.

There are eight hardware priority interrupt levels, level 0 having the highest priority and level 7 the lowest. The fifteen maskable interrupt sources (table 1) are divided into five groups, and each group can, under program control, be assigned to any one of the priority levels.

Interrupts may be serviced by routines entered either by vectoring or by context switching. Context switching automatically saves all the general registers, the program status word, and the program counter. Figure 6 illustrates the mechanism of context switching.

Finally, there is an optional macro service function that transfers data between any one special function register and memory without program intervention.

**Macro Service**

The macro service controller can be programmed to perform word or byte transfers. It can transfer data from a special function register to memory or from memory to a special function register. Transfer events are triggered by interrupt requests and take place without software intervention.

There are eight macro service channels; channel control information is stored in RAM. This information (figure 7) consists of a 16-bit memory address (optionally incremented at each transfer), an 8-bit special function register designator, and an 8-bit transfer counter (decremented at each transfer.) When the count equals 0, a context switch or vectored interrupt occurs.

Note:

- (1) Bits 0-3 of port 2 and port 3 are read-only.
- (2) P0H and P0L are 4-bit buffer registers used to store data to be loaded into the high and low nibbles of the real-time output (P0).
- (3) Bit 3 of the STBC is not affected by RESET (n = 0 or 8).
- (4) External registers interfaced with these addresses can be accessed by special function register addressing.
- (5) SP and PSW do not have real SFR addresses and can be accessed only by special instructions.

**Instruction Set**

The instruction set for the μPD78310/312 has 8- and 16-bit arithmetic instructions including a 16 x 16-bit unsigned multiply with a 32-bit product and a 32 by 16-bit unsigned divide with a 32-bit quotient and a 16-bit remainder. The instruction set also excutes an 8-bit and a 16-bit shift and rotate by count, 1- and 8-bit logic, and 1-, 2-, and 3-byte call instructions. String manipulation instructions are also included.

There are four addressing modes for unconditional branching. Branch instructions exist to test single bits in the program status word, the 16-bit accumulator, the special function registers, and internal RAM. The instruction set also includes multiple register PUSH and POP instructions.

Following are several tables explaining symbols, designations, and codes in the Instruction Set. Machine codes are omitted from the instructions but they are in the User's Manual.

**Symbols in the Operand and Operation Columns**

Symbol	Meaning
r	R0-R15
r1	R0-R7
r2	C,B
rp	RP0-RP7*
rp1	RP0-RP7*
rp2	DE, HL, VP, UP
sfr	Special function register, 8 bits
sfrp	Special function register, 16 bits
post	RP0, RP1, RP2, RP3, RP4, RP5/PSW, RP6, RP7 Bits set to 1 indicate register pairs to be pushed/popped to/from the stack RP5 pushed/popped by PUSH/POP: SP is stack pointer PSW pushed/popped by PUSHU/POPU: RP5 is stack pointer
mem	(DE), (HL), (DE+), (HL+), (DE-), (HL-), (VP), (UP); register indirect (DE + A), (HL + A), (DE + B), (HL + B), (VP + DE), (VP + HL); base/index mode (DE + byte), (HL + byte), (VP + byte), (UP + byte), (SP + byte); base mode Word (A), word (B), word (DE), word (HL); index mode
saddr	FF20H-FF1FH: immediate byte addresses one byte in RAM, or label
saddrp	FE20H-FF1FH: immediate byte (bit 0 = 0) addresses one word in RAM
word	16 bits of immediate data
byte	8 bits of immediate data
jdisp	8-bit two's complement displacement (immediate data)
bit	3 bits of immediate data (bit position in byte), or label
n	3 bits of immediate data
addr16	0000H-FFFFH: 16-bit immediate address (up to FFFFH in MOV instruction)
laddr16	0000H-FFFFH: 16-bit absolute branch address (immediate data)
\$addr16	Relative branch address ((PC)+jdisp)
addr11	0800H-0FFFH: 0800H+ (11-bit immediate address), or label
addr5	0040H-007EH: 0040H + 2 x (5-bit immediate address), or label

**Symbols in the Operand and Operation Columns (cont)**

Symbol	Meaning
A	A register (8-bit accumulator)
X	X register
B	B register
C	C register
D	D register
E	E register
H	H register
L	L register
R0-R15	Register 0-15
AX	Register pair AX (16-bit accumulator)
BC	Register pair BC
DE	Register pair DE
HL	Register pair HL
RP0-RP7	Register pair 0-7
PC	Program counter
SP	Stack pointer
UP	User stack pointer (RP5)
PSW	Program status word
CY	Carry flag
AC	Auxiliary carry flag
Z	Zero flag
P/V	Parity/overflow flag
S	Sign flag
SUB	Subtract flag
TPF	Table position flag
RBS	Register bank select flag
RSS	Register set select flag
IE	Interrupt enable flag
EOS	End of software interrupt flag
STBC	Standby control register
WDM	Watchdog timer mode register
( )	Contents of the location whose address is within ( ); (+) and (-) indicate that the address is incremented after or decremented before it is used.
(( ))	Contents of the memory location defined by the contents of the location defined by the quantity within the (( )).
XXH	Hexadecimal number
XH, XL	High-order 8 bits and low-order 8 bits of X

\* rp and rp1 describe the same registers, but generate different machine code.

**Flag Indicators**

T-99-19-08

Symbol	Meaning
(blank)	No change
0	Cleared to 0
1	Set to 1
X	Set or cleared according to result
P	Parity of result
V	Arithmetic overflow
U	Undefined
R	Restored from saved PSW

**Execution Times of Memory Reference Instructions:  
Number of Processor States**

Instruction		Memory Reference Mode			
		Register Indirect	Base Index	Base	Index
MOV	A, mem mem, A	5	6	6	6
XCH	A, mem mem, A	7	8	8	8
ADD, ADDC, SUB, SUBC, AND, OR, XOR	A, mem mem, A	6 7	7 8	7 8	7 8
CMP	A, mem mem, A	6	7	7	7

**Memory Addressing Modes**

mem	mod			
	1 0 1 1 0	1 0 1 1 1	0 0 1 1 0	0 1 0 1 0
	Register Indirect	Base Index	Base	Index
0 0 0	(DE+)*	(DE + A)	(DE + byte)	word (DE)
0 0 1	(HL+)*	(HL + A)	(SP + byte)	word (A)
0 1 0	(DE-)*	(DE + B)	(HL + byte)	word (HL)
0 1 1	(HL-)*	(HL + B)	(UP + byte)	word (B)
1 0 0	(DE)*	(VP + DE)	(VP + byte)	—
1 0 1	(HL)*	(VP + HL)	—	—
1 1 0	(VP)	—	—	—
1 1 1	(UP)	—	—	—
