

### Description

The  $\mu$ PD8085A-2,  $\mu$ PD8085AH, and  $\mu$ PD8085AH-2 8-bit, single-chip microprocessors are 100 percent software compatible with the industry standard 8080A. They have the ability of increasing system performance of the 8080A by operating at a higher speed. Using the  $\mu$ PD8085A in conjunction with its family of ICs allows the designer complete flexibility with minimum chip count. The H (HMOS) versions have lower power consumptions than the non-H versions.

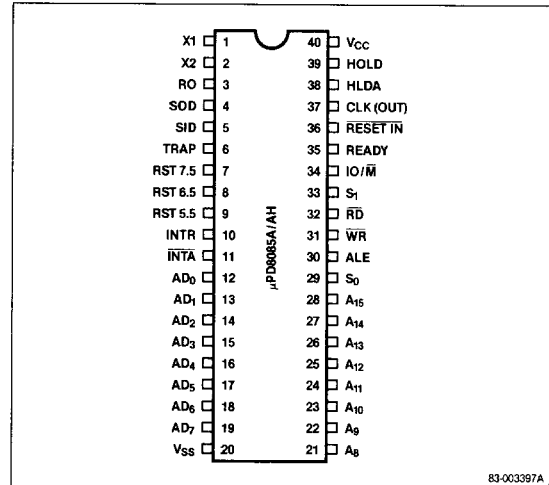

### Features

- Single power supply, +5 V,  $\pm 10\%$
- Internal clock generation and system control
- Internal serial in/out port
- Fully TTL-compatible
- Internal four-level interrupt structure
- Multiplexed address/data bus for increased system performance
- Complete family of components for design flexibility
- Software compatible with industry standard 8080A
- Higher throughput
  - $\mu$ PD8085A-2 — 5 MHz
  - $\mu$ PD8085AH — 3 MHz
  - $\mu$ PD8085AH-2 — 5 MHz

### Ordering Information

Part Number	Package Type	Max Frequency of Operation
$\mu$ PD8085AC-2	40-pin plastic DIP	5 MHz
$\mu$ PD8085AHC	40-pin plastic DIP	3 MHz
$\mu$ PD8085AHC-2	40-pin plastic DIP	5 MHz

### Pin Configuration

### Pin Identification

No.	Symbol	Function
1, 2	X1, X2	Crystal in
3	RO	Reset out
4	SOD	Serial out data
5	SID	Serial in data
6	TRAP	Trap interrupt input
7	RST 7.5	Restart interrupts
8	RST 6.5	Restart interrupts
9	RST 5.5	Restart interrupts
10	INTR	Interrupt request in
11	INTA	Interrupt acknowledge
12-19	AD <sub>0</sub> -AD <sub>7</sub>	Low address / data bus
20	V <sub>SS</sub>	Ground
21-28	A <sub>8</sub> -A <sub>15</sub>	High address bus
29, 33	S <sub>0</sub> , S <sub>1</sub>	Status outputs
30	ALE	Address latch enable out
31, 32	WR, RD	Write / read strobes out
34	IO / M	I / O or memory indicator
35	READY	Ready input
36	RESET IN	Reset input
37	CLK	Clock out
38, 39	HLDA, HOLD	Hold acknowledge out and hold input request
40	V <sub>CC</sub>	+5 V supply

**Pin Functions****Crystal In**

Crystal, RC, or external clock input.

**Reset Out**

Acknowledges that the processor is being reset to be used as a system reset.

**Serial Out Data**

1-bit data out by the SIM instruction.

**Serial In Data**

1-bit data into ACC bit 7 by the RIM instruction.

**Trap Interrupt Input**

Highest priority nonmaskable restart interrupt.

**Restart Interrupts**

Priority restart interrupt inputs, of which 7.5 is the highest and 5.5 the lowest priority.

**Interrupt Request In**

A general interrupt input which stops the PC from incrementing, generates  $\overline{INTA}$ , and samples the data bus for a restart or call instruction.

**Interrupt Acknowledge**

An output which indicates that the processor has responded to INTR.

**Low Address/Data Bus**

Multiplexed low address and data bus.

**Ground**

Ground Reference.

**High Address Bus**

Nonmultiplexed high 8 bits of the address bus.

**Status Outputs**

Outputs which indicate data bus status: Halt, Write, Read, Fetch.

**Address Latch Enable Out**

A signal which indicates that the lower 8 bits of address are valid on the AD lines.

**Write/Read Strobes Out**

Signals out which are used as write and read strobes for memory and I/O devices.

**I/O or Memory Indicator**

A signal out which indicates whether  $\overline{RD}$  or  $\overline{WR}$  strobes are for I/O or memory devices.

**Ready Input**

An input which is used to increase the data and address bus access times (can be used for slow memory).

**Reset Input**

An input which is used to start the processor activity at address 0, resetting IE and HLDA flip-flops.

**Clock Out**

System clock output.

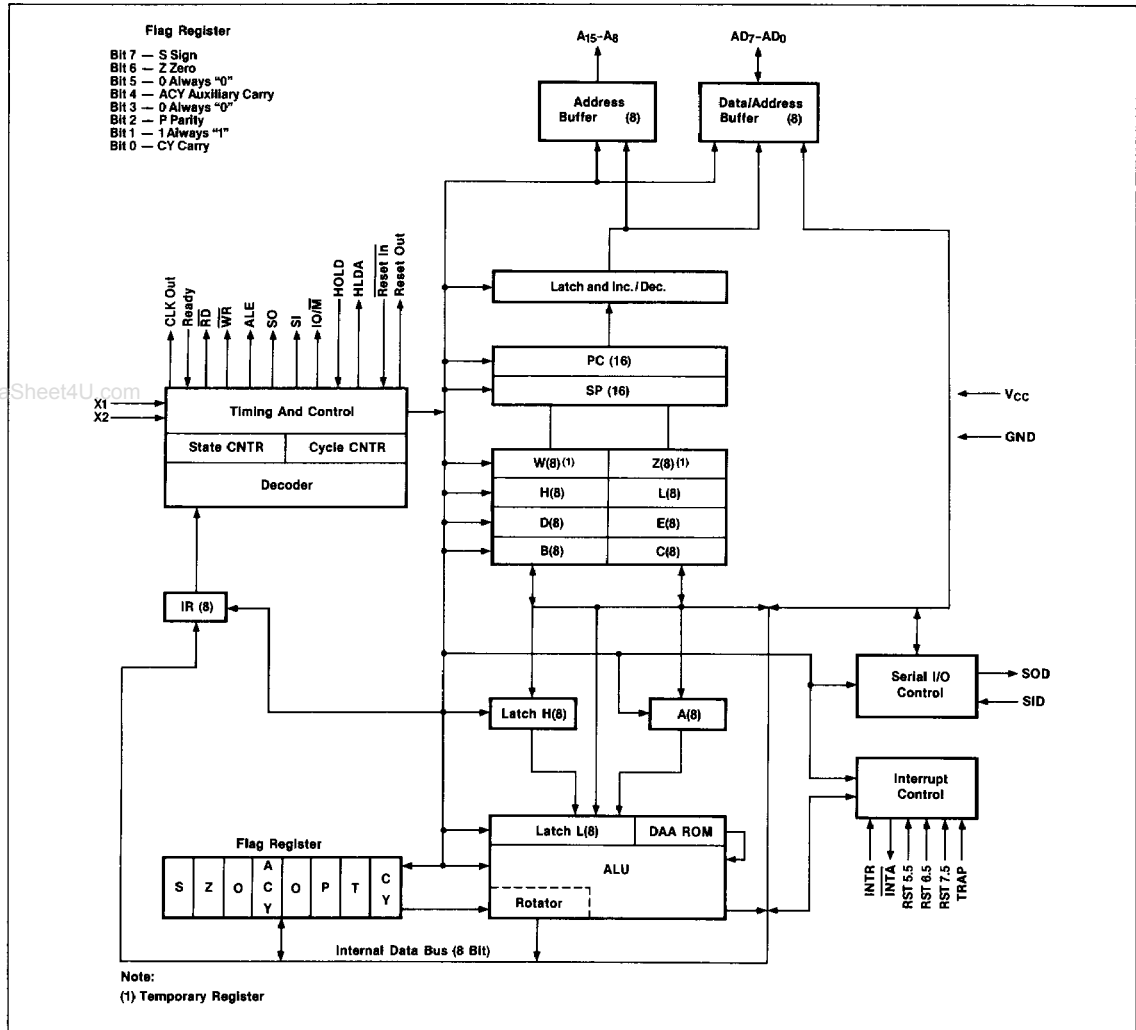

**Hold Acknowledge Out and Hold Input Request**

Used to request and indicate that the processor should relinquish the bus for DMA activity. When hold is acknowledged,  $\overline{RD}$ ,  $\overline{WR}$ ,  $IO/\overline{M}$ , address and data buses are all three-stated.

**+5 V Supply**

Power supply input.

## Block Diagram

**Absolute Maximum Ratings**

μPD8085A-2: T<sub>A</sub> = 25°C; V<sub>CC</sub> = +5 V ± 5%

Power supply voltage, V <sub>DD</sub>	-0.5 V to +7 V
Input voltage, V <sub>I</sub>	-0.5 V to +7 V
Output voltage, V <sub>O</sub>	-0.5 V to +7 V
Operating temperature, T <sub>OPR</sub>	0°C to +70°C
Storage temperature, T <sub>STG</sub>	-65°C to +150°C
Power dissipation, P <sub>D</sub>	1.5 W

**Comment:** Exposing the device to stresses above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational sections of this specification. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Leading edge of WR to data valid	t <sub>WDL</sub>		40		20	ns	

**Note:**

- A<sub>8</sub>-A<sub>15</sub> address specs apply to IO/M. S<sub>0</sub> and S<sub>1</sub> except A<sub>8</sub>-A<sub>15</sub> are undefined during T<sub>4</sub>-T<sub>6</sub> of OF cycle whereas IO/M, S<sub>0</sub> and S<sub>1</sub> are stable.
- Test conditions: t<sub>CYC</sub> = 320 ns (8085AH)/200 ns (8085A-2) C<sub>L</sub> = 150 pF
- For all output timing except where C<sub>L</sub> = 150 pF use the following correction factors:  
 25 pF, C<sub>L</sub> = 150 pF: - 0.10 ns/pF  
 150 pF, C<sub>L</sub> = 300 pF: +0.3 ns/pF
- Output timings are measured with purely capacitive load.
- All timings are measured as the following:  
 Output voltage: V<sub>L</sub> = 0.8 V, V<sub>H</sub> = 2.0 V  
 Input voltage: 1.5 V; t<sub>r</sub> = 20 ns
- To calculate timing specifications at other values of t<sub>CYC</sub> use Bus Timing Specifications.
- Data hold time is guaranteed under all loading conditions.

**Bus Timing Specifications**

**t<sub>CYC</sub> as a Dependent**

### 8085AH Bus Timing Read Operation

### Write Operation

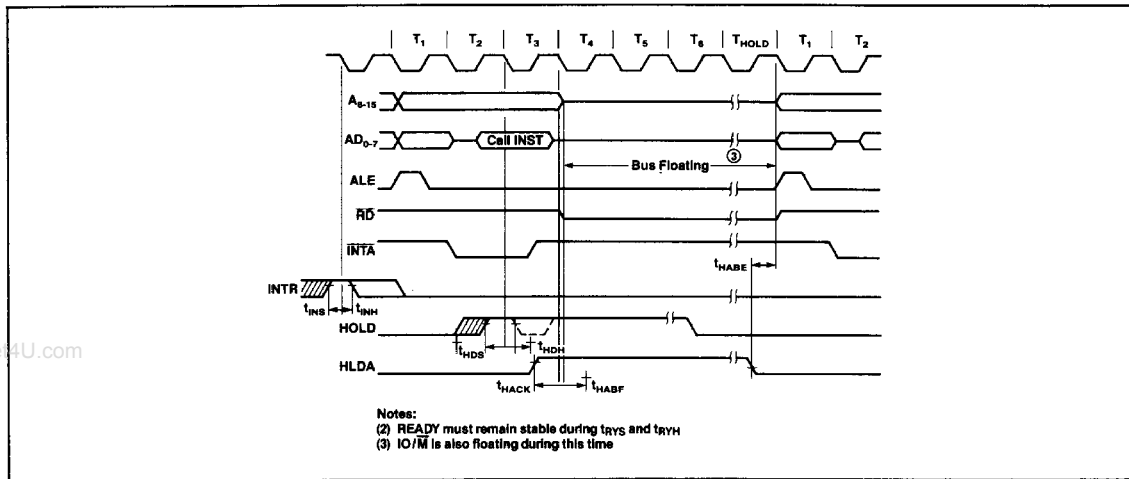

### Read Operation with Wait Cycle (same Ready Timing Applies to Write Operation)

- Notes:  
 (2) READY must remain stable during  $t_{RYS}$  and  $t_{RVH}$   
 (3) IO/M is also floating during this time

**Timing Waveforms (cont)**

**Interrupt and Hold Timing**

**Functional Description**

The μPD8085A contains six 8-bit data registers, an 8-bit accumulator, four testable flag bits, and an 8-bit parallel binary arithmetic unit. The μPD8085A also provides decimal arithmetic capability and it includes 16-bit arithmetic and immediate operators which greatly simplify memory address calculations, and high speed arithmetic operations.

The μPD8085A has a stack architecture wherein any portion of the external memory can be used as a last in/first out (LIFO) stack to store/retrieve the contents of the accumulator, the flags, or any of the data registers.

The μPD8085A also contains a 16-bit stack pointer to control the addressing of this external stack. One of the major advantages of the stack is that multiple level interrupts can easily be handled since complete system status can be saved when an interrupt occurs and then restored after the interrupt is complete. Another major advantage is that almost unlimited subroutine nesting is possible.

The μPD8085A was designed with speed and simplicity of the overall system in mind. The multiplexed address/data bus increases available pins for advanced functions in the processor and peripheral

chips while providing increased system speed and less critical timing functions. All signals to and from the μPD8085A are fully TTL-compatible.

The internal interrupt structure of the μPD8085A features 4 levels of prioritized interrupt with three levels internally maskable.

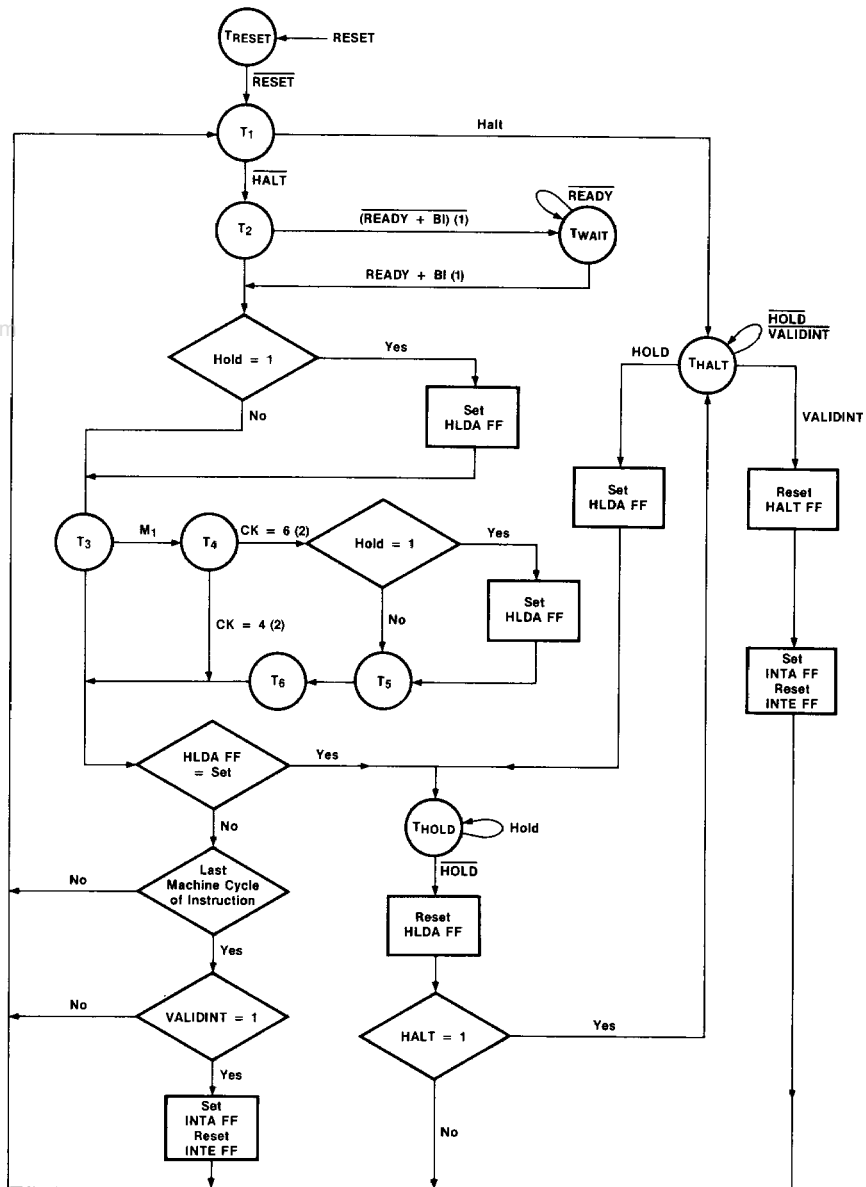

Communication on both the address lines and the data lines can be interlocked by using the HOLD input. When the hold acknowledge (HLDA) signal is issued by the processor, its operation is suspended and the address, data and control lines are forced to be in the FLOATING state. This permits other devices, such as direct memory access channels (DMA), to be connected to the address and data buses.

The μPD8085A features internal clock generation with status outputs available for advanced read/write timing and memory/IO instruction indications. The clock may be crystal controlled, RC controlled, or driven by an external signal.

On-chip serial in/out port is available and controlled by the newly added RIM and SIM instructions.

## Processor State Transition Diagram

Notes:  
 1. BI indicates that the bus is idle during this machine cycle.  
 2. CK indicates the number of clock cycles in this machine cycle.

### Clock Inputs

As stated, the timing for the μPD8085A may be generated in one of two ways: crystal, or external clock. Recommendations for these methods are shown below. Note the input frequency must be twice the internal operating frequency.

### Status Outputs

The status outputs are valid during ALE time and have the following meaning:

	S <sub>1</sub>	S <sub>0</sub>
Halt	0	0
Write	0	1
Read	1	0
Fetch	1	1

These pins may be decoded to portray the processor's data bus status.

### Interrupts

The μPD8085A has five interrupt pins available to the user. INTR is operationally the same as the 8080 interrupt request, three (3) internally maskable restart interrupts: RESTART 5.5, 6.5, and 7.5, and TRAP, a non-maskable restart.

Priority	Interrupt	Restart Address
Highest	TRAP	24 <sub>16</sub>
	RST 7.5	3C <sub>16</sub>
	RST 6.5	34 <sub>16</sub>
	RST 5.5	2C <sub>16</sub>
Lowest	INTR	

INTR, RST 5.5 and RST 6.5 are all level sensing inputs while RST 7.5 is set on a rising-edge. TRAP, the highest priority interrupt, is non-maskable and is set on the rising-edge or positive level. It must make a low-to-high transition and remain high to be seen, but it will not be generated again until it makes another low-to-high transition.

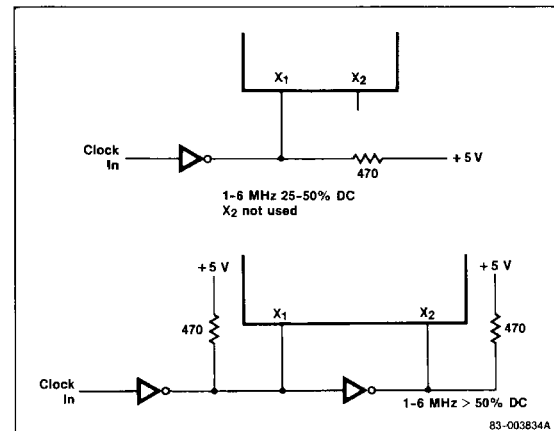

### RC

### Crystal

### External

## Serial I/O

Serial input and output is accomplished with two new instructions not included in the 8080: RIM and SIM. These instructions serve several purposes: serial I/O, and reading or setting the interrupt mask.

The RIM (Read Interrupt Mask) instruction is used for reading the interrupt mask and for reading serial data. After execution of the RIM instruction the ACC content is as follows:

**Note:**

(1) After the TRAP interrupt, the RIM instruction must be executed to preserve the status of IE.

The SIM (Set Interrupt Mask) instruction is used to program the interrupt mask and to output serial data. Presetting the ACC for the SIM instruction has the following meaning:

## Instruction Set

The instruction set includes arithmetic and logical operators with direct, register, indirect, and immediate addressing modes.

Move, load, and store instruction groups provide the ability to move either 8 or 16 bits of data between memory, the six working registers and the accumulator using direct, register, indirect, and immediate addressing modes.

The ability to branch to different portions of the program is provided with direct, conditional, or computed jumps. Also, the ability to call and return from subroutines is provided both conditionally and unconditionally. The RESTART (or single byte call instruction) is useful for interrupt vector operation.

Conditional jumps, calls and returns execute based on the state of the four testable flags (sign, zero, parity and carry). The state of each flag is determined by the result of the last instruction executed that affected flags. (See Instruction Set Table)

The sign flag is set (high) if bit 7 of the result is a "1"; otherwise it is reset (low). The zero flag is set if the result is "0"; otherwise it is reset. The parity flag is set if the modulo 2 sum of the bits of the result is "0" (even parity); otherwise (odd parity) it is reset. The carry flag is set if the last instruction resulted in a carry or a borrow out of the most significant bit (bit 7) of the result; otherwise it is reset.

In addition to the four testable flags, the μPD8085A has another flag (ACY) that is not directly testable. It is used for multiple precision arithmetic operations with the DAA instruction. The auxiliary carry flag is set if the last instruction resulted in a carry or a borrow from bit 3 into bit 4; otherwise it is reset.

Double precision operators such as stack manipulation and double add instructions extend both the arithmetic and interrupt handling capability of the μPD8085A. The ability to increment and decrement memory, the six general registers, and the accumulator are provided as well as extended increment and decrement instructions to operate on the register pairs and stack pointer. Further capability is provided by the ability to rotate the accumulator left or right through or around the carry bit.

Input and output may be accomplished using memory addresses as I/O ports or the directly addressed I/O provided for in the μPD8085A instruction set.

Two instructions, RIM and SIM, are used for reading and setting the internal interrupt mask as well as input and output to the serial I/O port.

The special instruction group completes the μPD8085A instruction set: NOP, HALT stop processor execution; DAA provides decimal arithmetic capability; STC sets the carry flag; CMC complements it; CMA complements the contents of the accumulator; and XCHG exchanges the contents of two 16-bit register pairs directly.

## Data and Instruction Formats

Data in the μPD8085A is stored as 8-bit binary integers. All data/instruction transfers to the system data bus are in the following format:

Instructions are one, two, or three bytes long. Multiple byte instructions must be stored in successive locations of program memory. The address of the first byte is used as the address of the instruction.

**One Byte Instructions**

D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>

HIGH ADDRESS OR OPERAND 2

## Instruction Cycle Times

One to five machine cycles (M<sub>1</sub>-M<sub>5</sub>) are required to execute an instruction. Each machine cycle involves the transfer of an instruction or data byte into the processor or a transfer of a data byte out of the processor (the sole exception being the double add instruction). The first one, two or three machine cycles obtain the instruction from the memory or an interrupting I/O controller. The remaining cycles are used to execute the instruction. Each machine cycle requires from three to five clock times (T<sub>1</sub>-T<sub>5</sub>).

Machine cycles and clock states used for each type of instruction are shown below.

Instruction Type	Machine Cycles Executed Min/Max	Clock Status Min/Max
ALU R	1	4
CMC	1	4

POP D	Pop register pair DE off stack	1	1	0	1	0	0	0	0	1	0	1	10				
POP H	Pop register pair HL off stack	1	1	1	0	0	0	0	0	1	0	1	10				
POP PSW	Pop A and flags off stack	1	1	1	1	0	0	0	0	1	0	1	10				
<b>Arithmetic Add</b>																	
ADD R	Add BC to HL	0	0	0	0	1	0	0	1	0	0	1	10				
ADD D	Add DE to HL	0	0	0	1	1	0	0	1	0	0	1	10				
ADD H	Add HL to HL	0	0	1	0	1	0	0	1	0	0	1	10				
ADD SP	Add stack pointer to HL	0	0	1	1	1	0	0	1	0	0	1	10				

## Instruction Set (cont)

Mnemonic(1)	Description	Operation Code(2)								Flags(4)				
		D7	D6	D5	D4	D3	D2	D1	D0	Cycles(3)	Sign	Zero	Parity	Carry
<b>Increment Register Pair</b>														
INX B	Increment BC	0	0	0	0	0	0	1	1	6				
INX D	Increment DE	0	0	0	1	0	0	1	1	6				
INX H	Increment HL	0	0	1	0	0	0	1	1	6				
INX SP	Increment stack pointer	0	0	1	1	0	0	1	1	6				
<b>Decrement Register Pair</b>														
DCX B	Decrement BC	0	0	0	0	1	0	1	1	6				
DCX D	Decrement DE	0	0	0	1	1	0	1	1	6				
DCX H	Decrement HL	0	0	1	0	1	0	1	1	6				
DCX SP	Decrement stack pointer	0	0	1	1	1	0	1	1	6				
<b>Register Indirect</b>														
STAX B	Store A at ADDR in BC	0	0	0	0	0	0	1	0	7				
STAX D	Store A at ADDR in DE	0	0	0	1	0	0	1	0	7				
LDAX B	Load A at ADDR in BC	0	0	0	0	1	0	1	0	7				
LDAX D	Load A at ADDR in DE	0	0	0	1	1	0	1	0	7				
<b>Direct</b>														
STA ADDR	Store A direct	0	0	1	1	0	0	1	0	13				
LDA ADDR	Load A direct	0	0	1	1	1	0	1	0	13				
SHLD ADDR	Store HL direct	0	0	1	0	0	0	1	0	16				
LHLD ADDR	Load HL direct	0	0	1	0	1	0	1	0	16				
<b>Move Register Pair</b>														
XCHG	Exchange DE and HL register pairs	1	1	1	0	1	0	1	1	4				
XTHL	Exchange top of stack and HL	1	1	1	0	0	0	1	1	16				
SPLH	HL to stack pointer	1	1	1	1	1	0	0	1	6				
PCHL	HL to program counter	1	1	1	0	1	0	0	1	6				
<b>Input / Output</b>														
IN A	Input	1	1	0	1	1	0	1	1	10				
OUT A	Output	1	1	0	1	0	0	1	1	10				
ENI	Enable interrupts	1	1	1	1	1	0	1	1	4				
DISI	Disable interrupts	1	1	1	1	0	0	1	1	4				
RM	Read interrupt mask	0	0	1	0	0	0	0	0	4				
SM	Set interrupt mask	0	0	1	1	0	0	0	0	4				
RST A	Restart	1	1	A	A	A	1	1	1	12				

**Instruction Set (cont)**

Mnemonic(1)	Description	Operation Code(2)										Flags(4)					
		D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>	Cycles(3)	Sign	Zero	Parity	Carry			
<b>Miscellaneous</b>																	
CMA	Complement A	0	0	1	0	1	1	1	1	1	1	1	1	4			
STC	Set carry	0	0	1	1	0	1	1	1	1	1	1	1	4			
CMC	Complement carry	0	0	1	1	1	1	1	1	1	1	1	1	4			1/Cy
DAA	Decimal adjust A	0	0	1	0	0	1	1	1	1	1	1	1	4	•	•	•
NOP	No operation	0	0	0	0	0	0	0	0	0	0	0	0	4			
HLT	Halt	0	1	1	1	0	1	0	1	1	0	1	0	5			

**Note:**

- (1) Operand symbols used
  - A = 8-bit address or expression
  - s = source register
  - d = destination register
  - PSW = Processor status word
  - SP = Stack pointer
  - D8 = 8-bit data quantity, expression, or constant, always B<sub>2</sub> of instruction
  - D16 = 16-bit data quantity, expression, or constant, always B<sub>3</sub>B<sub>2</sub> of instruction
  - ADDR = 16-bit memory address expression
- (2) odd or sss = 000-B, 001-C, 010-D, 011-E, 100-H, 101-L, 110-Memory, 111-A
- (3) Two possible cycle times (7/10) indicate instruction cycles dependent on condition flags.
- (4) • = flag affected
  - = flag not affected
  - 0 = flag reset
  - 1 = flag set

### μPD8085A Family Minimum System Configuration

A minimum computer system consisting of a processor, ROM, RAM, and I/O can be built with only 3 40-pin

packs. This system is shown below with its address, data, control buses and I/O ports.

#### Three Pack Computer System
