

## FEATURES

- +5 V to ±15 V operation
- Unipolar or bipolar operation
- True voltage output
- Double-buffered inputs
- Reset to minimum (DAC8413) or center scale (DAC8412)
- Fast bus access time
- Readback

## APPLICATIONS

- Automatic test equipment
- Digitally controlled calibration
- Servo controls
- Process control equipment

## GENERAL DESCRIPTION

The DAC8412/DAC8413 are quad, 12-bit voltage output DACs with readback capability. Built using a complementary BiCMOS process, these monolithic DACs offer the user very high package density.

Output voltage swing is set by the two reference inputs  $V_{REFH}$  and  $V_{REFL}$ . By setting the  $V_{REFL}$  input to 0 V and  $V_{REFH}$  to a positive voltage, the DAC provides a unipolar positive output range. A similar configuration with  $V_{REFH}$  at 0 V and  $V_{REFL}$  at a negative voltage provides a unipolar negative output range. Bipolar outputs are configured by connecting both  $V_{REFH}$  and  $V_{REFL}$  to nonzero voltages. This method of setting output voltage range has advantages over other bipolar offsetting methods because it is not dependent on internal and external resistors with different temperature coefficients.

Digital controls allow the user to load or read back data from any DAC, load any DAC, and transfer data to all DACs at one time.

An active low  $\overline{RESET}$  loads all DAC output registers to midscale for the DAC8412 and zero scale for the DAC8413.

The DAC8412/DAC8413 are available in 28-lead plastic DIP, 28-lead ceramic DIP, 28-lead PLCC, and 28-lead LCC packages.

## FUNCTIONAL BLOCK DIAGRAM

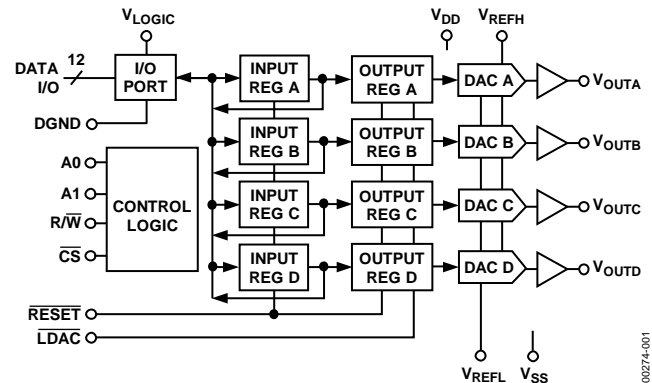

Figure 1.

They can be operated from a wide variety of supply and reference voltages with supplies ranging from single +5 V to ±15 V, and references from +2.5 V to ±10 V. Power dissipation is less than 330 mW with ±15 V supplies and only 60 mW with a +5 V supply.

For MIL-STD-883 applications, contact your local Analog Devices, Inc. sales office for the DAC8412/DAC8413/883 data sheet, which specifies operation over the -55°C to +125°C temperature range. All 883 parts are also available on Standard Military Drawings 5962-91 76401MXA through 76404M3A.

## ABSOLUTE MAXIMUM RATINGS

$T_A = +25^\circ\text{C}$ , unless otherwise noted.

**Table 3.**

Parameter	Rating
$V_{SS}$ to $V_{DD}$	$-0.3\text{ V}, +33.0\text{ V}$
$V_{SS}$ to $V_{\text{LOGIC}}$	$-0.3\text{ V}, +33.0\text{ V}$
$V_{\text{LOGIC}}$ to DGND	$-0.3\text{ V}, +7.0\text{ V}$
$V_{SS}$ to $V_{\text{REFL}}$	$-0.3\text{ V}, +V_{SS} - 2.0\text{ V}$
$V_{\text{REFH}}$ to $V_{DD}$	$+2.0\text{ V}, +33.0\text{ V}$
$V_{\text{REFH}}$ to $V_{\text{REFL}}$	$+2.0\text{ V}, V_{SS} - V_{DD}$
Current into Any $V_{SS}$ pin	$\pm 15\text{ mA}$
Digital Input Voltage to DGND	$-0.3\text{ V}, V_{\text{LOGIC}} + 0.3\text{ V}$
Digital Output Voltage to DGND	$-0.3\text{ V}, +7.0\text{ V}$
Operating Temperature Range	
EP, FP, FPC	$-40^\circ\text{C}$ to $+85^\circ\text{C}$
AT, BT, BTC	$-55^\circ\text{C}$ to $+125^\circ\text{C}$
Junction Temperature	$150^\circ\text{C}$
Storage Temperature Range	$-65^\circ\text{C}$ to $+150^\circ\text{C}$
Power Dissipation Package	$1000\text{ mW}$
Lead Temperature	JEDEC Industry Standard
Soldering	J-STD-020

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{JA}$  is specified for the worst-case mounting conditions, that is, a device in socket.

**Table 4. Thermal Resistance**

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
28-Lead Plastic DIP (PDIP)	48	22	$^\circ\text{C}/\text{W}$
28-Terminal Ceramic Leadless Chip Carrier (LLC)	70	28	$^\circ\text{C}/\text{W}$
28-Lead Plastic Leaded Chip Carrier (PLLC)	63	25	$^\circ\text{C}/\text{W}$
28-Lead Ceramic Dual In-Line Package (CERDIP)	51	9	$^\circ\text{C}/\text{W}$

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## THEORY OF OPERATION

### INTRODUCTION

The DAC8412/DAC8413 are quad, voltage output, 12-bit parallel input DACs featuring a 12-bit data bus with readback capability. The only differences between the DAC8412/DAC8413 are the reset functions. The DAC8412 resets to midscale (Code 0x800), and the DAC8413 resets to minimum scale (Code 0x000).

The ability to operate from a single 5 V supply is a unique feature of these DACs.

Operation of the DAC8412/DAC8413 can be viewed by dividing the system into three separate functional groups: the digital I/O and logic, the digital-to-analog converters, and the output amplifiers.

### DACS

Each DAC is a voltage switched, high impedance ( $R = 50\text{ k}\Omega$ ), R-2R ladder configuration. Each 2R resistor is driven by a pair of switches that connect the resistor to either  $V_{REFH}$  or  $V_{REFL}$ .

### GLITCH

Worst-case glitch occurs at the transition between Half-Scale Digital Code 1000 0000 0000 to half-scale minus 1 LSB, 0111 1111 1111. It can be measured at about  $2\text{ V }\mu\text{s}$  (see Figure 36). For demanding applications such as waveform generation or precision instrumentation control, a deglitcher circuit can be implemented with a standard sample-and-hold circuit (see Figure 37). When  $\overline{CS}$  is enabled by synchronizing the hold period to be longer than the glitch tradition, the output voltage can be smoothed with minimum disturbance. A quad sample-and-hold amplifier, SMP04, has been used to illustrate the deglitching result (see Figure 36).

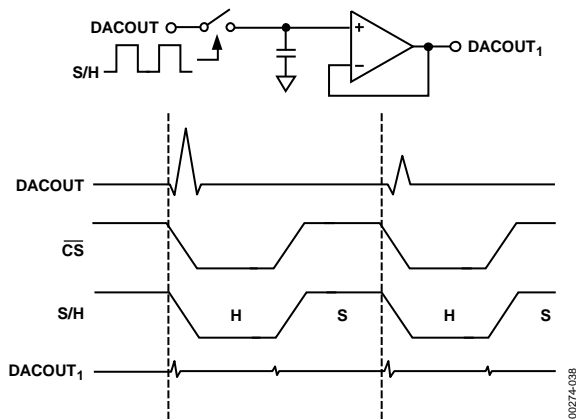

Figure 37. Data Output (Read Timing)

### REFERENCE INPUTS

All four DACs share common reference high ( $V_{REFH}$ ) and reference low ( $V_{REFL}$ ) inputs. The voltages applied to these reference inputs set the output high and low voltage limits of all four of the DACs. Each reference input has voltage restrictions with respect to the other reference and to the power supplies. The  $V_{REFL}$  can be set at any voltage between  $V_{SS}$  and  $V_{REFH} - 2.5\text{ V}$ , and  $V_{REFH}$  can be set to any value between  $+V_{DD} - 2.5\text{ V}$  and  $V_{REFL} + 2.5\text{ V}$ . Note that because of these restrictions, the DAC8412 references cannot be inverted (that is,  $V_{REFL}$  cannot be greater than  $V_{REFH}$ ).

It is important to note that the DAC8412  $V_{REFH}$  input both sinks and sources current. In addition, the input current of both  $V_{REFH}$  and  $V_{REFL}$  are code-dependent. Many references have limited current-sinking capability and must be buffered with an amplifier to drive  $V_{REFH}$ . The  $V_{REFL}$  has no such special requirements.

It is recommended that the reference inputs be bypassed with  $0.2\text{ }\mu\text{F}$  capacitors when operating with  $\pm 10\text{ V}$  references. This limits the reference bandwidth.

### DIGITAL I/O

See Table 6 for the digital control logic truth table. Digital I/O consists of a 12-bit bidirectional data bus, two registers select inputs, A0 and A1, a  $\overline{R/W}$  input, a  $\overline{RESET}$  input, a chip select ( $\overline{CS}$ ), and a load DAC ( $\overline{LDAC}$ ) input. Control of the DACs and bus direction is determined by these inputs as shown in Table 6. Digital data bits are labeled with the MSB defined as Data Bit 11 and the LSB as Data Bit 0. All digital pins are TTL/CMOS compatible.

See Figure 38 for a simplified I/O logic diagram. The register select inputs A0 and A1 select individual DAC registers A (Binary Code 00) through D (Binary Code 11). Decoding of the registers is enabled by the  $\overline{CS}$  input. When  $\overline{CS}$  is high, no decoding takes place, and neither the writing nor the reading of the input registers is enabled. The loading of the second bank of registers is controlled by the asynchronous  $\overline{LDAC}$  input. By taking  $\overline{LDAC}$  low while  $\overline{CS}$  is enabled, all output registers can be updated simultaneously. Note that the  $t_{LDW}$  required pulse width for updating all DACs is a minimum of 170 ns.

The  $\overline{R/W}$  input, when enabled by  $\overline{CS}$ , controls the writing to and reading from the input register.

### CODING

Both DAC8412/DAC8413 use binary coding. The output voltage can be calculated by

$$V_{OUT} = V_{REFL} + \frac{(V_{REFH} - V_{REFL}) \times N}{4096}$$

where  $N$  is the digital code in decimal.

**RESET**

The  $\overline{\text{RESET}}$  function can be used either at power-up or at any time during DAC operation. The  $\overline{\text{RESET}}$  function is independent of  $\overline{\text{CS}}$ . This pin is active low and sets the DAC output registers to either center code for the DAC8412, or zero code for the DAC8413. The reset-to-center code is most useful when the DAC is configured for bipolar references and an output of 0 V after reset is desired.

**SUPPLIES**

Supplies required are  $V_{SS}$ ,  $V_{DD}$ , and  $V_{\text{LOGIC}}$ . The  $V_{SS}$  supply can be set between  $-15\text{ V}$  and  $0\text{ V}$ .  $V_{DD}$  is the positive supply; its operating range is between  $5\text{ V}$  and  $15\text{ V}$ .

$V_{\text{LOGIC}}$  is the digital output supply voltage for the readback function. It is normally connected to  $+5\text{ V}$ . This pin is a logic reference input only. It does not supply current to the device. If the readback function is not being used,  $V_{\text{LOGIC}}$  can be left open-circuit. While  $V_{\text{LOGIC}}$  does not supply current to the DAC8412, it does supply currents to the digital outputs when readback is used.

**AMPLIFIERS**

Unlike many voltage output DACs, the DAC8412 features buffered voltage outputs. Each output is capable of both sourcing and sinking  $5\text{ mA}$  at  $\pm 10\text{ V}$ , eliminating the need for external amplifiers when driving  $500\text{ pF}$  or smaller capacitive load in most applications. These amplifiers are short-circuit protected.

Table 6. DAC8412/DAC8413 Logic Table

A1	A0	R/W	$\overline{\text{CS}}$	$\overline{\text{RS}}$	$\overline{\text{LDAC}}$	Input Register	Output Register	Mode	DAC
L	L	L	L	H	L	Write	Write	Transparent	A
L	H	L	L	H	L	Write	Write	Transparent	B
H	L	L	L	H	L	Write	Write	Transparent	C
H	H	L	L	H	L	Write	Write	Transparent	D
L	L	L	L	H	H	Write	Hold	Write input	A
L	H	L	L	H	H	Write	Hold	Write input	B
H	L	L	L	H	H	Write	Hold	Write input	C
H	H	L	L	H	H	Write	Hold	Write input	D
L	L	H	L	H	H	Read	Hold	Read input	A
L	H	H	L	H	H	Read	Hold	Read input	B
H	L	H	L	H	H	Read	Hold	Read input	C
H	H	H	L	H	H	Read	Hold	Read input	D
X	X	X	H	H	L	Hold	Update all output registers		All
X	X	X	H	H	H	Hold	Hold	Hold	All
X	X	X	X	L	X	All registers reset to midscale/zero-scale <sup>1</sup>			All
X	X	X	H	$\downarrow$	X	All registers latched to midscale/zero-scale <sup>1</sup>			All

<sup>1</sup> DAC8412 resets to midscale, and DAC8413 resets to zero scale. L = logic low; H = logic high; X = don't care. Input and output registers are transparent when asserted.

Figure 38. Simplified I/O Logic Diagram

Careful attention to grounding is important for accurate operation of the DAC8412. This is not because the DAC8412 is more sensitive than other 12-bit DACs, but because with four outputs and two references, there is greater potential for ground loops. Because the DAC8412 has no analog ground, the ground must be specified with respect to the reference.

## REFERENCE CONFIGURATIONS

Output voltage ranges can be configured as either unipolar or bipolar, and within these choices, a wide variety of options exists. The unipolar configuration can be either positive or negative voltage output, and the bipolar configuration can be either symmetrical or nonsymmetrical.

Figure 39. Unipolar +10V Operation

Figure 40. Symmetrical Bipolar Operation

Figure 40 (symmetrical bipolar operation) shows the DAC8412 configured for  $\pm 10$  V operation. See the [AD688](#) data sheet for a full explanation of reference operation. Adjustments may not be required for many applications since the AD688 is a very high accuracy reference. However, if additional adjustments are required, adjust the DAC8412 full scale first. Begin by loading the digital full-scale code (0xFFF), and then adjust the gain adjust potentiometer to attain a DAC output voltage of 9.9976 V. Then, adjust the balance adjust to set the center-scale output voltage to 0.000 V.

The 0.2  $\mu\text{F}$  bypass capacitors shown at the reference inputs in Figure 40 should be used whenever  $\pm 10\text{ V}$  references are used. Applications with single references or references to  $\pm 5\text{ V}$  may not require the 0.2  $\mu\text{F}$  bypassing. The 6.2  $\Omega$  resistor in series with the output of the reference amplifier keeps the amplifier from oscillating with the capacitive load. This 6.2  $\Omega$  resistor has been found to be large enough to stabilize this circuit. Larger resistor values are acceptable, provided that the drop across the resistor does not exceed  $V_{\text{BE}}$ . Assuming a minimum  $V_{\text{BE}}$  of 0.6 V and a maximum current of 2.75 mA, then the resistor should be under 200  $\Omega$  for the loading of a single DAC8412.

Using two separate references is not recommended. Having two references can cause different drifts with time and temperature; whereas with a single reference, most drifts track.

Unipolar positive full-scale operation can usually be set with a reference with the correct output voltage. This is preferable to using a reference and dividing down to the required value. For a 10 V full-scale output, the circuit can be configured as shown in Figure 41. In this configuration, the full-scale value is set first by adjusting the 10 k $\Omega$  resistor for a full-scale output of 9.9976 V.

Figure 41. Unipolar -10V Operation

Figure 41 shows the DAC8412 configured for -10 V to 0 V operation. A -10 V full-scale output voltage reference is connected directly to  $V_{\text{REFL}}$  for the reference voltage.

**SINGLE +5 V SUPPLY OPERATION**

For operation with a 5 V supply, the reference voltage should be set between 1.0 V and 2.5 V for optimum linearity. Figure 42 shows a REF43 used to supply a 2.5 V reference voltage. The headroom of the reference and DAC are both sufficient to support a 5 V supply with  $\pm 5\%$  tolerance.  $V_{\text{DD}}$  and  $V_{\text{LOGIC}}$  should be connected to the same supply. Separate bypassing to each pin should also be used.
