DL8835 LED Driver IC

DESGRIPTION

DL8835 is an LED Controller driven on a 1/4 to 1/7 duty factor. Twelve/nine segment output lines, 4 to 7 grid output lines, one display memory, control circuit are all incorporated into a single chip to build a highly reliable peripheral device for a single chip microcomputer. Serial data is fed to DL8835 via a three-line serial interface. Housed in a 24-pin SO Package, DL8835's pin assignments and application circuit are optimized for easy PCB Layout and cost saving advantages.

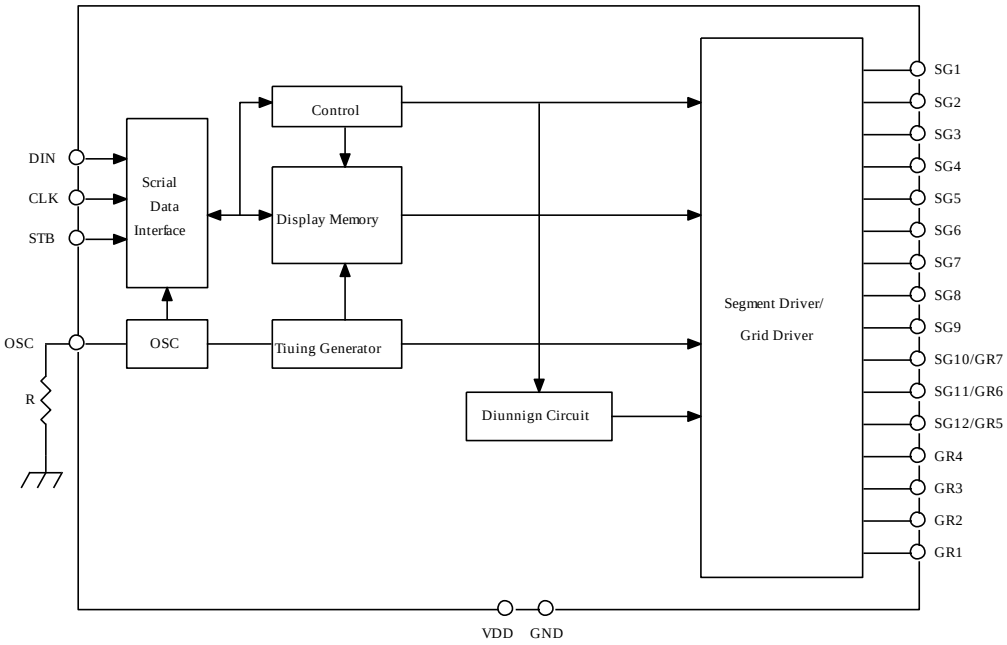
FEATURES

- CMOS Technology
- Low Power Consumption
- 8-Step Dimming Circuitry
- Serial Interface for Clock, Data Input, Strobe Pins
- Available in 24-pin, SO Package

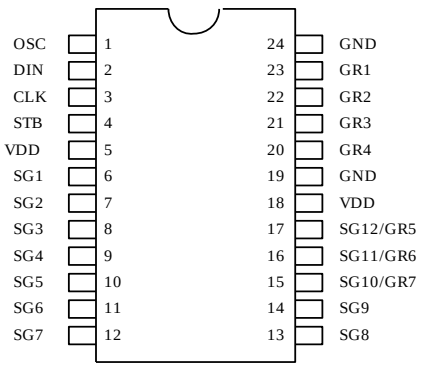
APPLICATION

- Micro-computer Peripheral Device

BLOCK DIAGRAM



PIN CONFIGURATION

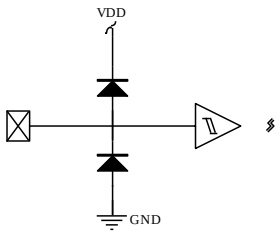


DL8835 LED Driver IC

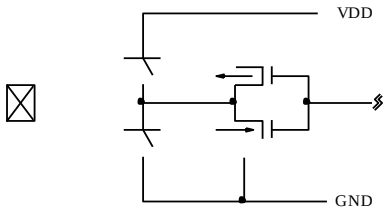
INPUT / OUTPUT CONFIGURATIONS

The SGhematic diagrams of the input and output circuits of the logic section are shown below.

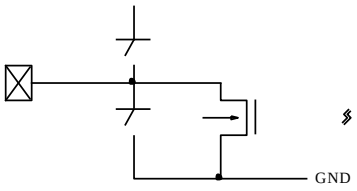
Input Pins: CLK, STB & DIN



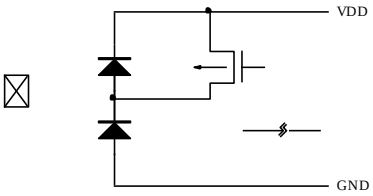
Output Pins: SG10/GR7, SG11/GR6, SG12/GR5



Output Pins: GR1 to GR4



Output Pins: SG1 to SG9



PIN DESGRIPTION

Pin Name	I/O	DeSGription	Pin NO.
OSG	I	OSGillator Input Pin A resistor is connected to this pinto determine the oSGillation frequency	1
DIN	I	Data Input Pin This pin inputs serial data at the rising edge of the shift clock (starting from the lower bit)	2
CLK	I	Clock Input Pin This pin reads serial data at the rising edge.	3
STB	I	Serial Interface Strobe Pin The data input after the STB has fallen is processed as a command. When this pin is “ HIGH ”, CLK is ignored.	4
VDD	-	Power Supply	5,18
SG1 to SG9	O	Segment Output Pins (p-channel, open drain)	6~14
SG10/GR7 to SG12/GR5	O	Segment Output Pin/Grid Output Pin (CMOS Output)	15~17
GND	-	Ground Pin	19,24
GR4 to GR1	O	Grid Output Pins (n-channel, open drain)	20~23

FUNCTIONAL DESGRIPTION

Commands

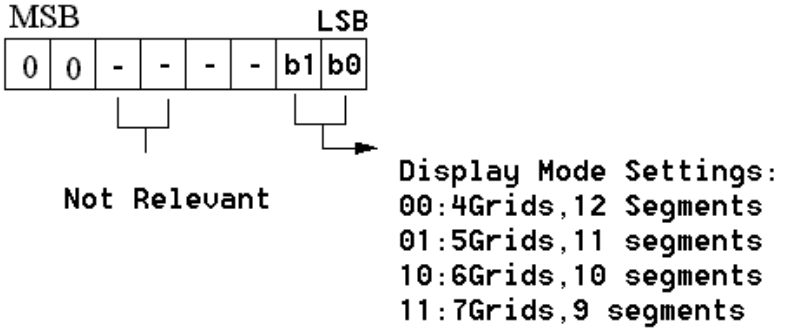
A command is the first byte (b0 to b7) inputted to DL8835 via the DIN Pin after STB Pin has changed from "HIGH" to "LOW" State. If for some reason the STB Pin is set to "HIGH" while data or commands are being transmitted, the serial communication is initialized, and the data/commands being transmitted are consid-ered invalid.

COMMAND 1: DISPLAY MODE SETTING COMMANDS

DL8835 provides 4 display mode settings as shown in the diagram below: As stated earlier a command is the first one byte (b0 to b7) transmitted to DL8835 via the DIN Pin when STB is "LOW". However, for these commands, Bit No. 3 to Bit No.6 (b2 to b5) are ignored, Bit No. 7 & Bit No. 8 (b6 to b7) are given a value of "0".

The Display Mode Setting Commands determine the number of segments and grids to be used (1/4 to 1/7 duty, 12 to 9 segments). When these commands are exceuted, the display is forcibly turned off. A display command "ON" must be executed in order to resume display. If the same mode setting is selected, no command execution is take place, therefore, nothing happens.

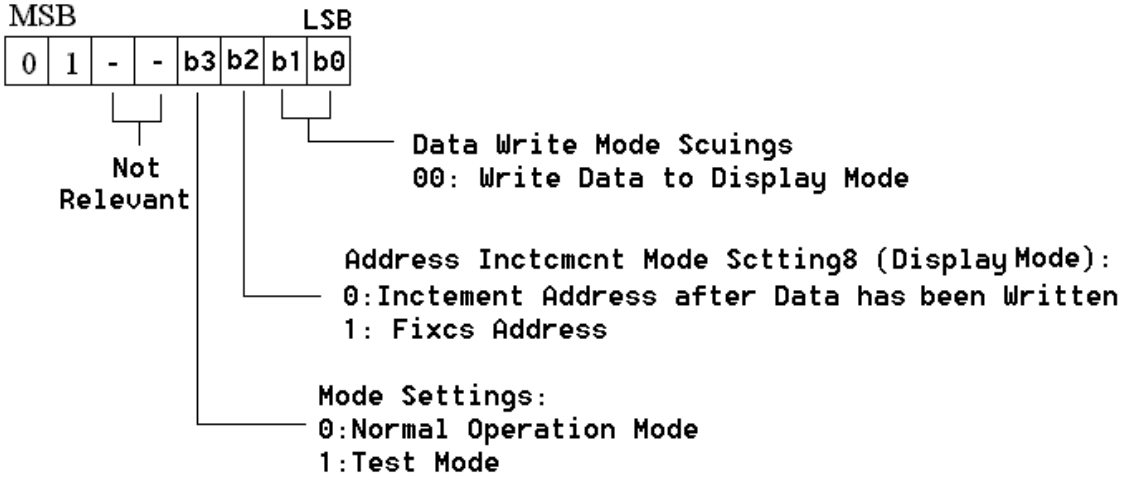
When Power is turned "ON", the 7-Grid , 9-Segment Mode is selected.



COMMAND 2: DATA SETTING COMMANDS

The Data Setting Commands executes the Data Write Mode for DL8835. The Data Setting Command, the bits 5 and 6 (b4, b5) are ignored, bit 7 (b6) is given the value of "1" while bit 8 (b7) is given the value of "0". Please refer to the diagram below.

When power is turned ON, bit 4 to bit 1 (b3 to b0) are given the value of "0".

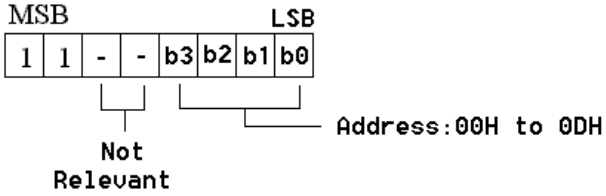


COMMAND 3: ADDRESS SETTING COMMANDS

Address Setting Commands are used to set the address of the display memory. The address is

considered valid if it has a value of "00H" to 0DH". If the address is set to 0EH or higher, the data is ignored until a valid address is set. When power is turned ON, the address is set at "00H".

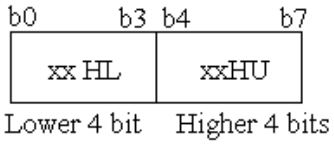
Please refer to the diagram below.



Display Mode and RAM Address

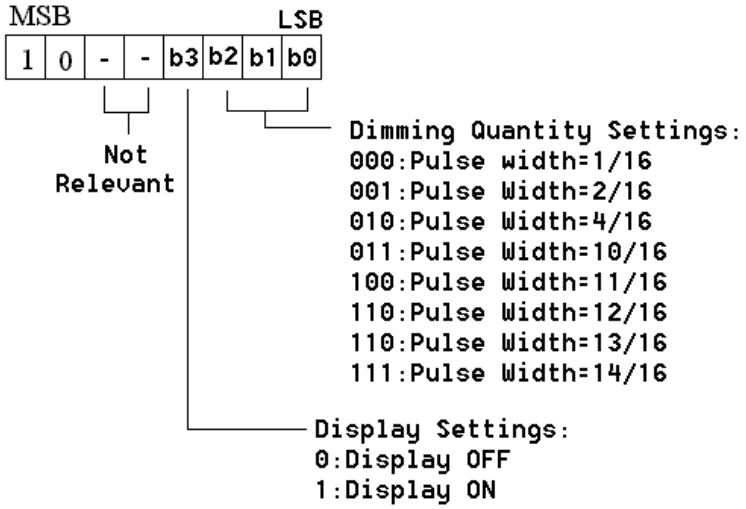
Data transmitted from an external device to DL8835 via the serial interface are stored in the Display RAM and are assigned addresses. The RAM Addresses of DL8835 are given below in 8 bits unit.

SG1	SG4	SG5	SG8	SG9	SG12	
00HL		00HU		01HL		DIG1
02HL		02HU		03HL		DIG2
04HL		04HU		05HL		DIG3
06HL		06HU		07HL		DIG4
08HL		08HU		09HL		DIG5
0AHL		0AHU		0BHL		DIG6
0CHL		0CHU		0DHL		DIG7

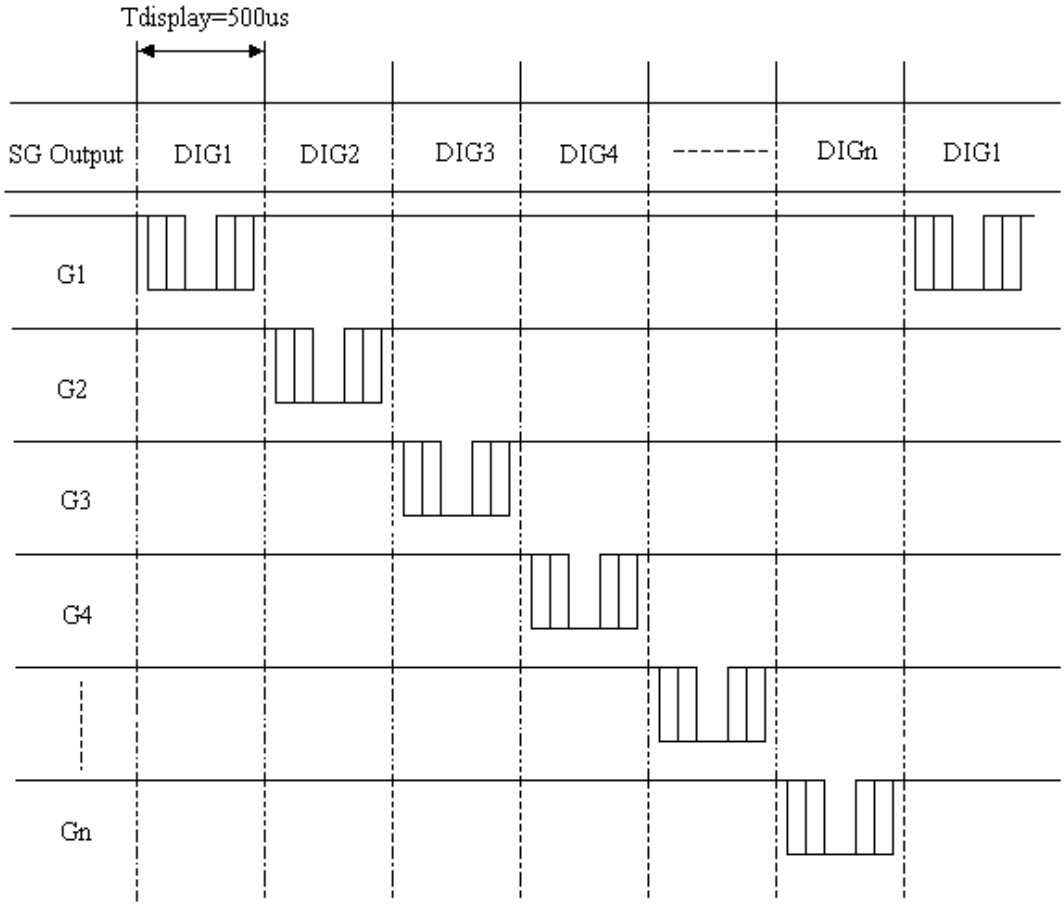


COMMAND 4: DISPLAY CONTROL COMMANDS

The Display Control Commands are used to turn ON or OFF a display. It also used to set the pulse width. Please refer to the diagram below. When the power is turned ON, a 1/16 pulse width is selected and the displayed is turned OFF.

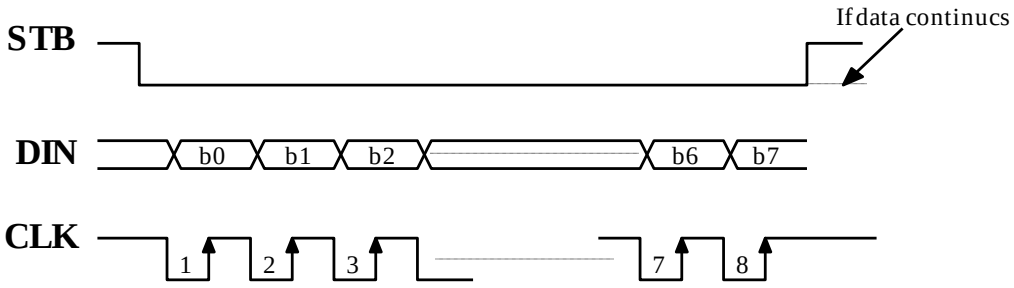


DISPLAY TIMING WAVEFORM



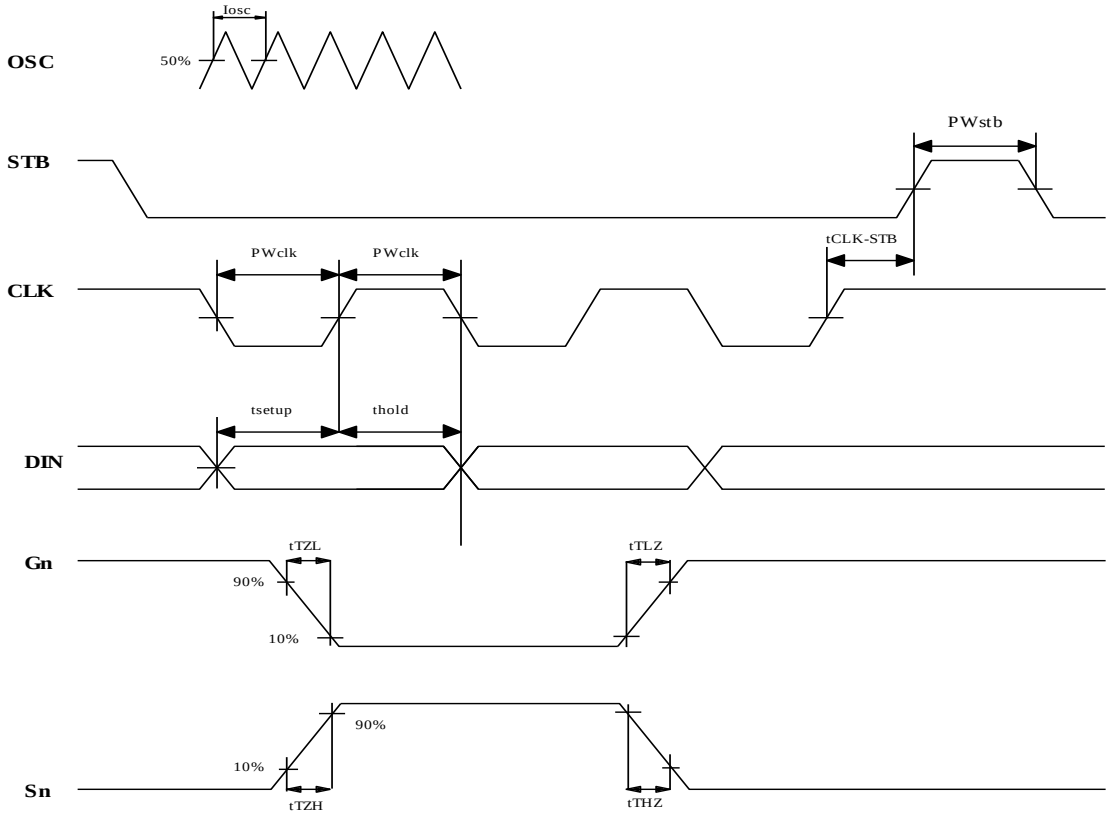
SERIAL COMMUNICATION FORMAT

The following diagram shows the DL8835 serial communication format.



SWITCHING CHARACTERISTIC WAVEFORM

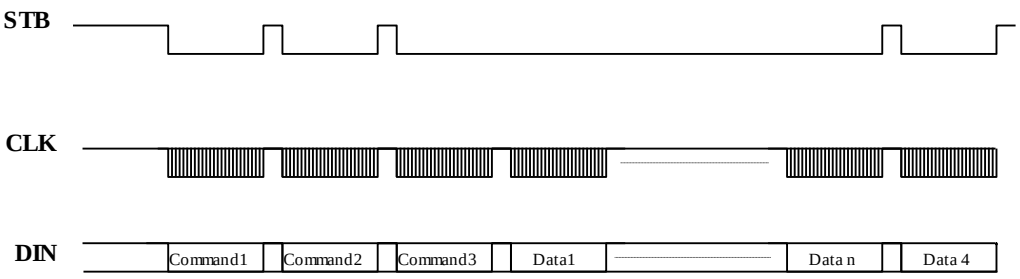
DL8835 Switching Characteristics Waveform is given below.



where: PW_{CLK}(Clock Pulse Width)≧400ns PW_{STB}(Strobe Pulse Width) ≧1μ s
t setup (Data Setup Time) ≧100ns thold (Data Hold Time) ≧100ns
$t_{CLK-STB}$ (Clock-Strobe Time) ≧1μ s t_{THZ} (fall Time)≦10μ s
t_{TZH} (Rise Time) ≦1μ s foSG= OSGillation Frequency
t_{TZL} <1μ s t_{TLZ}<10μ s

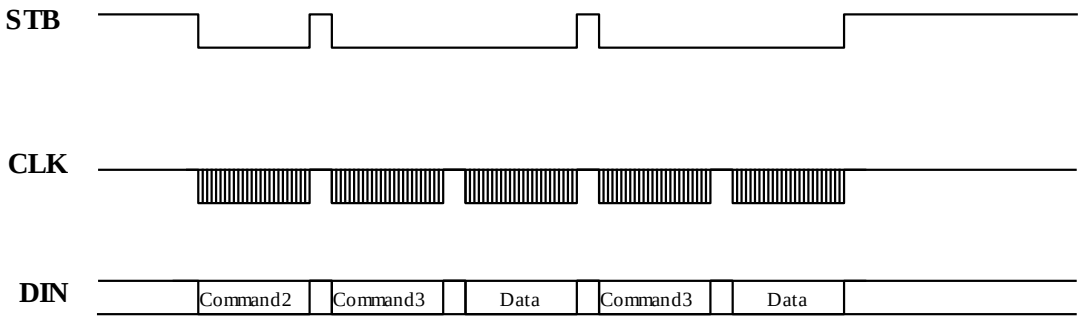
APPLICATIONS

Display memory is updated by is incrementing addresses. Please refer to the following diagram.



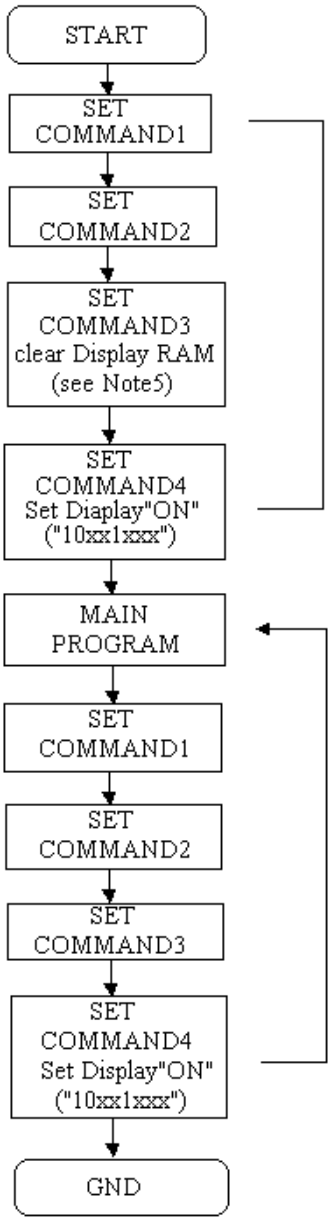
where: Command 1: Display Mode Setting
Command 2: Data Setting Command
Command 3: Address Setting Command
Data 1 to n : Transfer Display Data (14 Bytes max.)
Command 4: Display Control Command

The following diagram shows the waveforms when updating specific addresses.



Where: Command2-- Data Setting Command
Command3-- Address Setting Command
Data--Display Data

RECOMMENDED SOFTWARE PROGRAMMING FLOWCHART

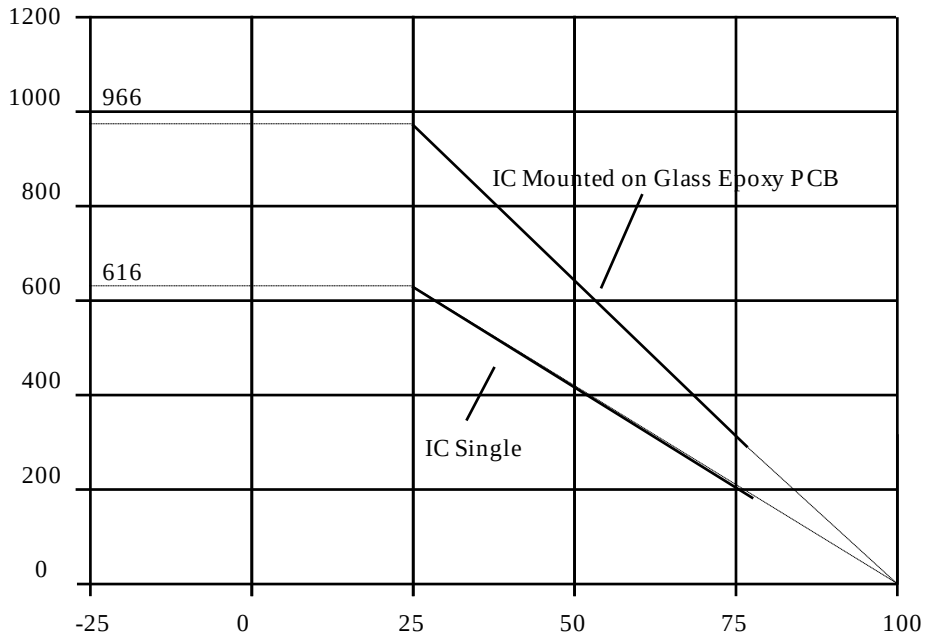


Note: 1. Command 1: Display Mode Setting Commands
2. Command 2: Data Setting Commands

3. Command 3 : Address Setting Commands
4. Command 4: Display Control Commands
5. When IC power is applied for the first time, the contents of the Display RAM are not defined; thus, it is strongly suggested that the contents of the Display RAM must be cleared during the initial setting.

SOP 24L (300MIL)THERMAL PERFORMANCE IN STILL AIR

Junction Temperature:100 ℃



ABSOLUTE MAXIMUM RATINGS

(Unless otherwise stated, Ta=25℃,GND=0V)

Parameter	Symbol	Rating	Units
Supply Voltage	V_{DD}	-5.0 to +7.0	Volt
Logic Input Voltage	V_I	-0.5 to VDD+0.5	Volts
Driver Output Current/Pin	I_{OLGR}	+250	mA
	I_{OHSG}	-50	mA
Maximum Driver Output Current/Total	I_{TOTAL}	400	mA

RECOMMENDED OPERATING RANGE

(Unless otherwise stated, Ta=-20 to +70℃,GND=0V)

Parameter	Symbol	Min.	Typ.	Max.	Unit
Logic Supply Voltage	V_{DD}	4.5	5	5.5	V
Dynamic Current (see Note)	I_{DDdyn}	-	-	5	mA
High-Level Input Voltage	V_{IH}	$0.8V_{DD}$	-	V_{DD}	V
Low-Level Input Voltage	V_{IL}	0	-	$0.3V_{DD}$	V

Note: Test Condition: Set Display Control Commands = 80H (Display Turn OFF State)

ELECTRICAL CHARACTERISTICS

(Unless otherwise stated, VDD=5V, GND=0V,Ta=25℃)

Parameter	Symbol	Test Condition	Min.	Typ.	Max.	Unit

High-Level Output Current	$I_{OHSG(1)}$	$V_O=V_{DD}$-1V SG1 to SG9, SG10/GR7 to SG12/GR5	-10	-14	-30	mA
	$I_{OHSG(2)}$	$Vo=V_{DD}$-2V SG1 to SG9, SG10/GR7 to SG12/GR5	-20	-25	-50	mA
