DM54S195/DM74S195 4-Bit Parallel Access Shift Registers

General Description

These 4-bit registers feature parallel inputs, parallel outputs, J-$\overline{K}$ serial inputs, shift/load control input, and a direct overriding clear. All inputs are buffered to lower the input drive requirements. The registers have two modes of operation:

Parallel (broadside) load

Shift (in the direction Q_A toward Q_D)

Parallel loading is accomplished by applying the four bits of data and taking the shift/load control input low. The data is loaded into the associated flip-flop and appears at the outputs after the positive transition of the clock input. During loading, serial data flow is inhibited.

Shifting is accomplished synchronously when the shift/load control input is high. Serial data for this mode is entered at the J-$\overline{K}$ inputs. These inputs permit the first stage to perform as a J-$\overline{K}$, D, or T-type flip-flop as shown in the truth table.

The high-performance S195, with a 105 MHz typical shift frequency, is particularly attractive for very high-speed data processing systems. In most cases existing systems can be upgraded merely by using this Schottky-clamped shift register.
