DM74LS161A • DM74LS163A Synchronous 4-Bit Binary Counters

General Description

These synchronous, presettable counters feature an internal carry look-ahead for application in high-speed counting designs. The D M74LS161A and D M74LS163A are 4-bit binary counters. The carry output is decoded by means of a N OR gate, thus pr eventing spikes d uring the n ormal counting mode of operation. Synchronous operation is provided by having all flip-flops clocked simultaneously so that the outputs change coincident with each oth er when so instructed by the count-enable inputs and internal gating. This mode e of operation e liminates the output co unting spikes which are normally associated with asynchronous (ripple clock) counters. A buffered clock input triggers the clock input waveform.

These counters are fully programmable; that is, the outputs may be preset to either level. As presetting is synchronous, setting up a low level at the load input disables the counter and causes the outputs to a gree with the setup data after the next clock pulse, regardless of the levels of the enable input. The clear function for the DM74LS161A is asynchronous: and a low level at the clear input sets all four of the flip-flop outputs L OW, regardless of the levels of c lock, load, o r enable i nputs. T he c lear fu nction for t he DM74LS163A is synchronous; and a low level at the clear inputs sets all four of the flip-flop outputs LOW after the next clock pulse, regardless of the levels of the enable inputs. This synchronous clear allows the count length to be mo dified easily, as dec oding the maximum count desired can be a ccomplished with on e e xternal N AND gate. The gate output is connected to the clear input to synchronously clear the counter to all low outputs.

The carry I ook-ahead ci rcuitry provides for r cascading counters for n- bit sync hronous ap plications without additional ga ting. Ins trumental i n a ccomplishing th is function are two count-enable inputs and a ripple carry output.

Both count-enable inputs (P and T) must be HIGH to count, and input T is fed forward to enable the ripple carry output. The ripple carry output thus enabled will produce a high-level output pulse with a duration approximately equal to the high-level portion of the Q_A output. This high-level overflow ripple carry pulse can be used to enable successive cascaded s tages. H IGH-to-LOW I evel t ransitions at the enable P or T inputs may occur, regardless of the logic level of the clock.

These counters fe ature a fully independent clock circuit. Changes made to control inputs (enable P or T or load) that will modify the operating mode have no effect until clocking occurs. The function of the counter (whether enabled, disabled, loading, or counting) will be dictated so lely by the conditions meeting the stable set-up and hold times.

Features

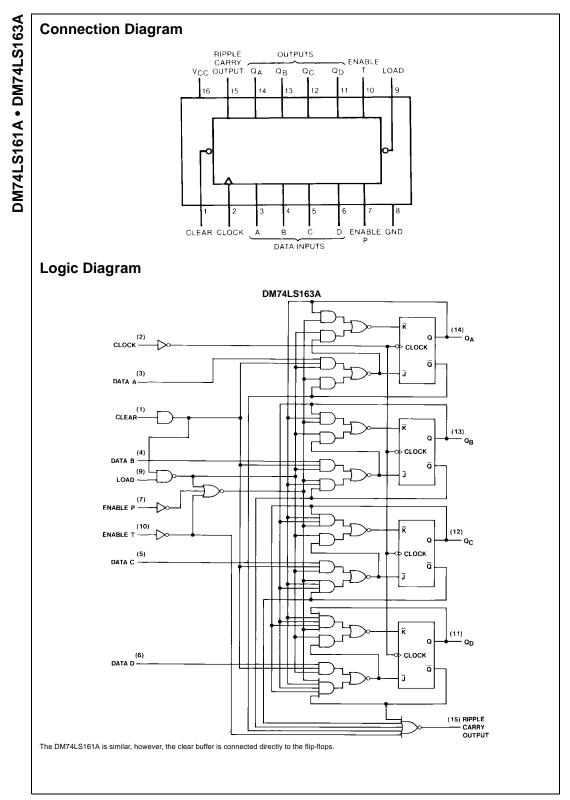

- Synchronously programmable
- Internal look-ahead for fast counting
- Carry output for n-bit cascading
- Synchronous counting
- Load control line
- Diode-clamped inputs
- Typical propagation time, clock to Q output 14 ns
- Typical clock frequency 32 MHz
- Typical power dissipation 93 mW

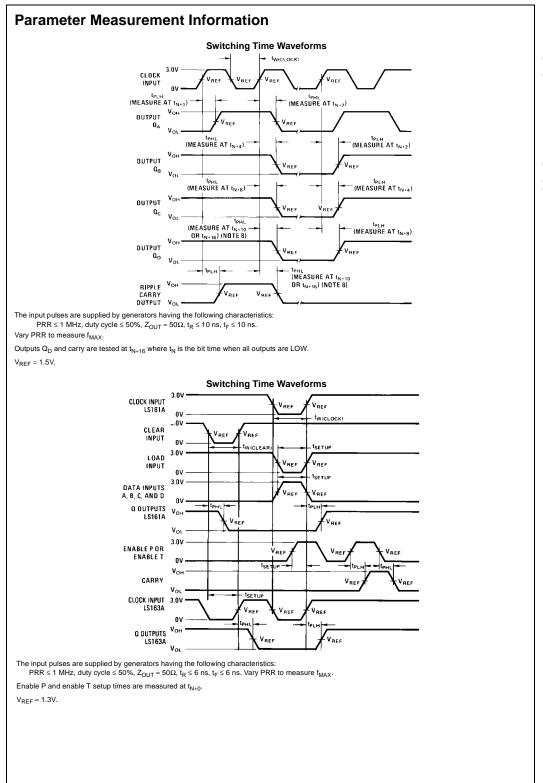

Ordering Code:

Order Number	Package Number	Package Description
DM74LS161AM	M16A	16-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-012, 0.150 Narrow
DM74LS161AN	N16E	16-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300 Wide
DM74LS163AM	M16A	16-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-012, 0.150 Narrow
DM74LS163AN	N16E	16-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300 Wide

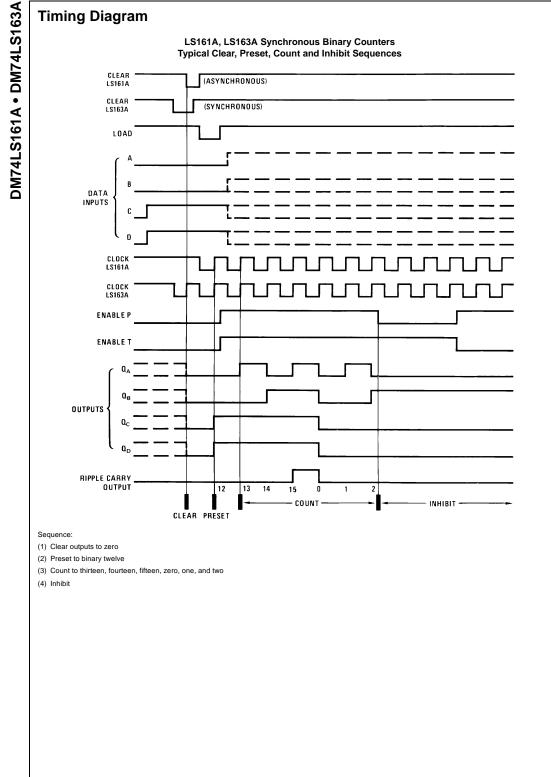

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code

DM74LS161A • DM74LS163A

Absolute Maximum Ratings(Note 1)

Supply Voltage	7V
Input Voltage	7V
Operating Free Air Temperature Range	$0^{\circ}C$ to $+70^{\circ}C$
Storage Temperature Range	$-65^{\circ}C$ to $+150^{\circ}C$

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the E lectrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

DM74LS161A Recommended Operating Conditions

Note 12: I_{CCH} is measured with the load HIGH, then again with the load LOW, with all other inputs HIGH and all outputs OPEN.

Note 13: I_{CCL} is measured with the clock input HIGH, then again with the clock input LOW, with all other inputs LOW and all outputs OPEN.
