DM54LS503/DM74LS503 8-Bit Successive Approximation Register (with Expansion Control)

General Description

The 'LS503 register is basically the same as the 'LS502 except that it has an active LOW Enable ($\overline{E}$) input that is used in cascading two or more packages for longer word lengths. A HIGH signal on $\overline{E}$, after a START operation, forces Q7 HIGH and prevents the device from accepting serial data. With the $\overline{E}$ input of an 'LS503 connected to the $\overline{CC}$ output of a preceding (more significant) device, the 'LS503 will be inhibited until the preceding device is filled, causing its $\overline{CC}$ output to go LOW. This LOW signal then enables the 'LS503 to accept the serial data on subsequent clocks. For a description of the starting, shifting and conversion operations, please see the 'LS502 data sheet.

Features

- Performs serial-to-parallel conversion
- Expansion control for longer words
- Storage and control for successive approximation A to D conversion
- Low power Schottky version of 2503
