

Low-Jitter Configurable HCSL-LVPECL Oscillator

General Description

The DSC2042 series of high performance dual output oscillators utilize a proven silicon MEMS technology to provide excellent jitter and stability while incorporating additional device functionality. The two outputs are controlled by separate supply voltages to allow for high output isolation. The frequencies of the outputs can be identical or independently derived from a common PLL frequency source. The DSC2042 has provision for up to eight user-defined pre-programmed, pin selectable output frequency combinations.

DSC2042 is packaged in a 14-pin 3.2x2.5 mm QFN package and available in temperature grades from Ext. Commercial to Industrial.

Operational Description

The DSC2042 is a dual oscillator with an HCSL output and an LVPECL output. The device consists of a MEMS resonator and a support PLL IC. The two outputs are generated through independent 8-bit programmable dividers from the output of the internal PLL. Two constraints are imposed on the output frequencies: 1) $f_2 = M \times f_1 / N$, where M and N are even integers between 4 and 254, 2) $1.2\text{GHz} < N \times f_2 < 1.7\text{GHz}$.

The actual frequencies output by the DSC2042 are controlled by an internal pre-programmed

memory (OTP). This memory stores all coefficients required by the PLL for up to eight different frequency combinations. Three control pins (FS0 – FS2) select the output frequency combination. Discera supports customer defined versions of the DSC2042. Standard frequency options are described in in the following sections.

When Enable (pin 1) is floated or connected to VDD, the DSC2042 is in operational mode. Driving Enable to ground will tri-state both output drivers (hi-impedance mode).

Output Clock Frequencies

Table 1 lists the standard frequency configurations and the associated ordering information to be used in conjunction with the ordering code. Customer defined combinations are available.

Table 1. Pre-programmed pin-selectable output frequency combinations

Ordering Info	Freq (MHz)	Freq Select Bits [FS2, FS1, FS0] – Default is [111]							
		000	001	010	011	100	101	110	111

MXXXXX	f _{OUT1}	Contact factory for additional configurations.							
	f _{OUT2}								

Frequency select bit are weakly tied high so if left unconnected the default setting will be [111] and the device will output the associated frequency highlighted in **Bold**.

0* – denotes invalid selection, output frequency is not specified.
