

DSP56001A

Product Preview

24-BIT DIGITAL SIGNAL PROCESSOR

The DSP56001A is an MPU-style general purpose Digital Signal Processor (DSP) composed of an efficient 24-bit DSP core, program and data memories, various peripherals, and support circuitry. The DSP56000 core is fed by on-chip Program RAM, two independent data RAMs, and two data ROMs containing sine, A-law, and μ -law tables. The DSP56001A contains a Serial Communication Interface (SCI), a Synchronous Serial Interface (SSI), and a parallel Host Interface (HI). This combination of features, illustrated in **Figure 1**, makes the DSP56001A a cost-effective, high-performance solution for high-precision general purpose digital signal processing. The DSP56001A is intended as a replacement for the DSP56001. The DSP56002 should be considered for new designs.

Data Sheet Conventions

This data sheet uses the following conventions:

- OVERBAR** Used to indicate a signal that is active when pulled low; for example, the **RESET** pin is active when low
- “asserted” Means that a high true (active high) signal is high or that a low true (active low) signal is low
- “deasserted” Means that a high true (active high) signal is low or that a low true (active low) signal is high

Examples:	Signal/Symbol	Logic State	Signal State	Voltage
	\overline{PIN}	True	Asserted	V_{IL}/V_{OL}
	\overline{PIN}	False	Deasserted	V_{IH}/V_{OH}
	PIN	True	Asserted	V_{IH}/V_{OH}
	PIN	False	Deasserted	V_{IL}/V_{OL}

Note: Values for V_{IL} , V_{OL} , V_{IH} , and V_{OH} are defined by individual product specifications.

DSP56001A FEATURES

Digital Signal Processing Core

- Efficient, object code compatible, 24-bit 56000 family DSP engine
- Up to 16.5 Million Instructions Per Second (MIPS)—60.6 ns instruction cycle at 33 MHz
- Up to 99 Million Operations Per Second (MOPS) at 33 MHz
- Executes a 1024-point complex Fast Fourier Transform (FFT) in 59,898 clocks
- Highly parallel instruction set with unique DSP addressing modes
- Two 56-bit accumulators including extension byte
- Parallel 24×24 -bit multiply-accumulate in 1 instruction cycle (2 clock cycles)
- Double precision 48×48 -bit multiply with 96-bit result in 6 instruction cycles
- 56-bit addition/subtraction in 1 instruction cycle
- Fractional arithmetic with support for multiprecision arithmetic
- Hardware support for block-floating point FFT
- Hardware nested DO loops
- Zero-overhead fast interrupts (2 instruction cycles)
- Four 24-bit internal data buses and three 16-bit internal address buses for maximum information transfer on-chip

Memory

- On-chip modified Harvard architecture permitting simultaneous accesses to program and two data memories
- 512×24 -bit on-chip Program RAM and 64×24 -bit bootstrap ROM
- Two 256×24 -bit on-chip data RAMs
- Two 256×24 -bit on-chip data ROMs containing sine, A-law and μ -law tables
- External memory expansion with 16-bit address and 24-bit data buses
- Bootstrap loading from external data bus or Host Interface

Peripheral and Support Circuits

- Byte-wide Host Interface (HI) with Direct Memory Access (DMA) support
- Synchronous Serial Interface (SSI) to communicate with codecs and synchronous serial devices
 - 8-, 12-, 16-, and 24-bit word sizes
 - Up to 32 software-selectable time slots in Network mode
- Serial Communication Interface (SCI) for full-duplex asynchronous communications
- On-chip peripheral registers memory mapped in data memory space
- Double-buffered peripherals
- Up to twenty-four General Purpose I/O (GPIO) pins
- Two external interrupt request pins

Miscellaneous Features

- Power-saving Wait and Stop modes
- Fully static, HCMOS design for operating frequencies from 33 MHz down to 4 MHz
- 88-pin Ceramic Pin Grid Array (PGA) package; 13 × 13 array
- 132-pin Plastic Quad Flat Pack (PQFP) surface-mount package; 24 × 24 × 4 mm
- 132-pin Ceramic Quad Flat Pack (CQFP) surface-mount package; 22 × 22 × 4 mm
- 5 V power supply

PRODUCT DOCUMENTATION

The three documents listed in **Table 1** are required for a complete description of the DSP56001A and are necessary to design properly with the part. Documentation is available from one of the following locations (see back cover for detailed information):

- A local Motorola distributor
- A Motorola semiconductor sales office
- A Motorola Literature Distribution Center
- The World Wide Web (WWW)

Table 1 DSP56001A Documentation

Topic	Description	Order Number
DSP56001 User's Manual	Detailed description of the 56001 architecture, 24-bit DSP, memory, peripherals, and instruction set	DSP56001UM/AD
DSP56001A Data Sheet	Pin and package descriptions, and electrical and timing specifications	DSP56001A/D

Related Documentation

Table 2 lists additional documentation relevant to the DSP56001A.

Table 2 DSP56001A Related Documentation

Document Name	Description	Order Number
Digital Sine-Wave Synthesis	Application Report; uses the DSP56001 look-up table	APR1/D
Digital Stereo 10-band Graphic Equalizer	Application Report; includes code and circuitry; features the DSP56001	APR2/D
Fractional and Integer Arithmetic	Application Report; includes code	APR3/D
Implementation of Fast Fourier Transforms	Application Report; comprehensive FFT algorithms and code for DSP56001, DSP56156, and DSP96002	APR4/D
Implementation of PID Controllers	Application Report; PWM using the SCI timer and three phase output using modulo addressing	APR5/D
Convolutional Encoding and Viterbi Decoding with a V.32 Modem Trellis Example	Application Report; theory and code; features the DSP56001	APR6/D
Implementing IIR/FIR Filters	Application Report; comprehensive example using the DSP56001	APR7/D
Principles of Sigma-Delta Modulation for A-to-D Converters	Application Report; features the DSP56ADC16; improving resolution with half-band filters	APR8/D
Full-Duplex 32-kbit/s CCITT ADPCM Speech Coding	Application Report; features the DSP56001	APR9/D
DSP56001 Interface Techniques and Examples	Application Report; interfaces for pseudo Static RAM, Dynamic RAM, ISA bus, Host Interface	APR11/D

Table 2 DSP56001A Related Documentation (Continued)

Document Name	Description	Order Number
Twin CODEC Expansion Board for the DSP56000 ADS	Application Report; circuit, code, FIR filter design for two voice band codecs connecting to the SSI	APR12/D
Conference Bridging in the Digital Telecommunications Environment	Application Report; theory and code; features the DSP56001/002	APR14/D
Implementation of Adaptive Controllers	Application Report; adaptive control using reference models; generalized predictive control; includes code	APR15/D
Calculating Timing Requirements of External SRAM	Application Report; determination of SRAM speed for optimum performance	APR16/D
Low Cost Controller for DSP56001	Application Report; circuit and code to connect two DSP56001s to an MC68008	APR402/D
G.722 Audio Processing	Application Report; theory and code using SB-ADPCM	APR404/D
Minimal Logic DRAM Interface	Application Report; 1M x 480 ns DRAM, 1 PAL, code	APR405/D
Logarithmic/Linear Conversion Routines	Application Report; μ -law and A-law companding routines for PCM mono-circuits	ANE408/D
Third Party Compendium	Brochures from companies selling hardware and software that supports Motorola DSPs	DSP3RDPTYPAK/D
University Support Program	Flyer; Motorola's program supporting Universities in DSP research and education	BR382/D
Technical Training Schedule	Technical Training Schedule	BR348AD/D
Audio Course Information	Audio Course Information	BR928/D
Real Time Signal Processing Applications with Motorola's DSP56000 Family	Textbook by Mohamed El-Sharkawy; 398+ pages. (This is a charge item.)	Prentice-Hall, 1990; ISBN 0-13-767138-5

SECTION 1

SIGNAL/PIN DESCRIPTIONS

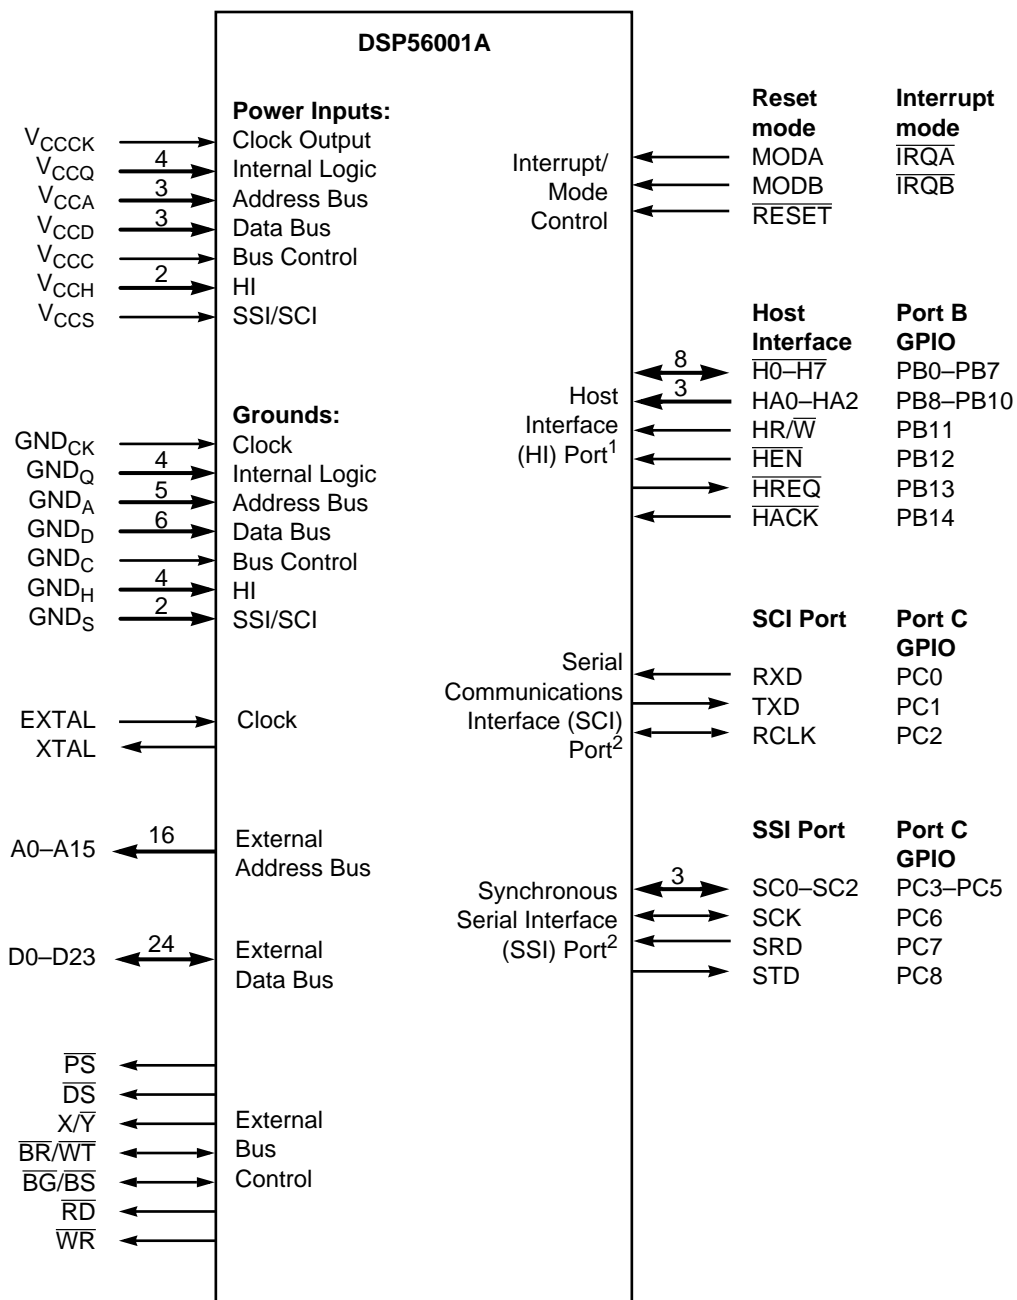

INTRODUCTION

DSP56001A signals are organized into twelve functional groups as summarized in **Table 1-1**.

Table 1-1 Signal Functional Group Allocations

Functional Group		Number of Signals	Detailed Description
Power (V_{CCX})		5	Table 1-2
Ground (GND_X)		7	Table 1-3
Clock		2	Table 1-4
Address Bus	Port A ¹	16	Table 1-5
Data Bus		24	Table 1-6
Bus Control		7	Table 1-7
Interrupt and Mode Control		3	Table 1-8
Host Interface (HI) Port	Port B ²	15	Table 1-9
Serial Communications Interface (SCI) Port	Port C ³	3	Table 1-10
Synchronous Serial Interface (SSI) Port		6	Table 1-11
Note: <ol style="list-style-type: none"> 1. Port A signals define the External Memory Interface port. 2. Port B signals are GPIO signals multiplexed on the external pins also used with the HI signals. 3. Port C signals are GPIO signals multiplexed on the external pins also used by the SCI and SSI ports. 			

Figure 1-1 is a diagram of DSP56001A signals by functional group.

- Note:
1. The Host Interface port signals are multiplexed with the Port B GPIO signals (PB0–PB15).
 2. The SCI and SSI signals are multiplexed with the Port C GPIO signals (PC0–PC8).
 3. Power and ground lines are indicated for the 144-pin TQFP package.

AA0885

Figure 1-1 Signals Identified by Functional Group

POWER

Table 1-2 Power Connections

Power Names	Description
V _{CCQ} (2)	Internal Logic Power —These lines supply a quiet power source to the oscillator circuits and the mode control and interrupt lines. Ensure that the input voltage to this line is well-regulated and uses an extremely low impedance path to tie to the V _{CC} power rail. Use a 0.1 μF bypass capacitor located as close as possible to the chip package to connect between the V _{CCQ} lines and the GND _Q lines.
V _{CCA} (3)	Address Bus Power —These lines supply power to the address bus.
V _{CCD} (3)	Data Bus Power —These lines supply power to the data bus.
V _{CC}	Bus Control Power —This line supplies power to the bus control logic.
V _{CCH} (2)	Host Interface Power —These lines supply power to the Host Interface logic.
V _{CCS}	Serial Interface Power —This line supplies power to the serial interface logic (SCI and SSI).

GROUND

Table 1-3 Ground Connections

Ground Names	Description
GND _Q (2)	Internal Logic Ground —These lines supply a quiet ground connection for the oscillator circuits and the mode control and interrupt lines. Ensure that this line connects through an extremely low impedance path to ground. Use a 0.1 μF bypass capacitor located as close as possible to the chip package to connect between the V _{CCQ} line and the GND _Q line.
GND _A (2)	Address Bus Ground —These lines connect system ground to the address bus.
GND _D (2)	Data Bus Ground —These lines connect system ground to the data bus.
GND _H (1)	Host Interface Ground —These lines supply ground connections for the Host Interface logic.

CLOCK
Table 1-4 Clock Signals

Signal Name	Signal Type	State during Reset	Signal Description
EXTAL	Input	Input	External Clock/Crystal Input —This input should be connected to an external crystal or to an external oscillator.
XTAL	Output	Chip-driven	Crystal Output —This output connects the internal crystal oscillator output to an external crystal. If an external oscillator is used, XTAL should be left unconnected.

ADDRESS BUS
Table 1-5 Address Bus Signals

Signal Names	Signal Type	State during Reset	Signal Description
A0–A15	Output	Tri-stated	Address Bus —These signals specify the address for external program and data memory accesses. If there is no external bus activity, A0–A15 remain at their previous values to reduce power consumption. A0–A15 are tri-stated when the bus grant signal is asserted.

DATA BUS
Table 1-6 Data Bus Signals

Signal Names	Signal Type	State during Reset	Signal Description
D0–D23	Input/Output	Tri-stated	Data Bus —These signals provide the bidirectional data bus for external program and data memory accesses. D0–D23 are tri-stated when the \overline{BG} or \overline{RESET} signal is asserted.

BUS CONTROL
Table 1-7 Bus Control Signals

Signal Name	Signal Type	State during Reset	Signal Description
\overline{PS}	Output	Tri-stated	Program Memory Select — \overline{PS} is asserted low for external program memory access. \overline{PS} is tri-stated when the \overline{BG} or \overline{RESET} signal is asserted.
\overline{DS}	Output	Tri-stated	Data Memory Select — \overline{DS} is asserted low for external data memory access. \overline{DS} is tri-stated when the \overline{BG} or \overline{RESET} signal is asserted.
X/\overline{Y}	Output	Tri-stated	X/\overline{Y} External Memory Select —This output is driven low during external Y data memory accesses. It is also driven low during external exception vector fetches when operating in the Development mode. X/\overline{Y} is tri-stated when the \overline{BG} or \overline{RESET} signal is asserted.
\overline{BR} \overline{WT}	Input/ Output	Tri-stated	<p>Bus Request/Wait—The bus request input \overline{BR} allows another device such as a processor or DMA controller to become master of the external data bus D0–D23 and external address bus a0–a15. When operating mode register (OMR) bit 7 is clear and \overline{BR} is asserted, the DSP56001A will always release the external data bus D0–D23, address bus A0–A15, and bus control signals \overline{PS}, \overline{DS}, X/\overline{Y}, \overline{RD}, and \overline{WR} (i.e. Port A), by tri-stating these pins after execution of the current instruction has been completed.</p> <p>If OMR bit 7 is set, this pin is an input that allows an external device to force wait states during an external Port A operation for as long as \overline{WT} is asserted.</p> <p>Note: To prevent erroneous operation, pull up the $\overline{BR}/\overline{WT}$ signal when it is not in use.</p>
\overline{BG} \overline{BS}	Input/ Output	Tri-stated	<p>Bus Grant/Bus Select—If OMR Bit 7 is clear, this output is asserted to acknowledge an external bus request after Port A has been released.</p> <p>If OMR Bit 7 is set, this signal is bus strobe, and is asserted when the DSP accesses Port A.</p>
\overline{WR}	Output	Tri-stated	Write Enable — \overline{WR} is asserted during external memory write cycles. \overline{WR} is tri-stated when the \overline{BG} or \overline{RESET} signal is asserted.
\overline{RD}	Output	Tri-stated	Read Enable — \overline{RD} is asserted during external memory read cycles. \overline{RD} is tri-stated when the \overline{BG} or \overline{RESET} signal is asserted.

INTERRUPT AND MODE CONTROL
Table 1-8 Interrupt and Mode Control Signals

Signal Name	Signal Type	State during Reset	Signal Description
MODA $\overline{\text{IRQA}}$	Input	Input	<p>Mode Select A/External Interrupt Request A—This input has two functions:</p> <ol style="list-style-type: none"> to select the initial chip operating mode, and after synchronization, to allow an external device to request a DSP interrupt. <p>MODA is read and internally latched in the DSP on exit from Reset. MODA and MODB select the initial chip operating mode. After leaving the Reset state, the MODA signal changes to external interrupt request $\overline{\text{IRQA}}$. The chip operating mode can be changed by software after reset. The $\overline{\text{IRQA}}$ input is a synchronized external interrupt request that indicates that an external device is requesting service. It may be programmed to be level-sensitive or negative-edge-triggered. If level-sensitive triggering is selected, an external pull up resistor is required for wired-OR operation. If the processor is in the Stop state and $\overline{\text{IRQA}}$ is asserted, the processor will exit the Stop state.</p>
MODB $\overline{\text{IRQB}}$	Input	Input	<p>Mode Select B/External Interrupt Request B—This input has two functions:</p> <ol style="list-style-type: none"> to select the initial chip operating mode, and after internal synchronization, to allow an external device to request a DSP interrupt. <p>MODB is read and internally latched in the DSP on exit from Reset. MODA and MODB select the initial chip operating mode. After leaving the Reset state, the MODB signal changes to external interrupt request $\overline{\text{IRQB}}$. After reset, the chip operating mode can be changed by software. The $\overline{\text{IRQB}}$ input is an external interrupt request that indicates that an external device is requesting service. It may be programmed to be level sensitive or negative-edge-triggered. If level-sensitive triggering is selected, an external pull up resistor is required for wired-OR operation.</p>
$\overline{\text{RESET}}$	Input	Input	<p>Reset—This input is a direct hardware reset on the processor. When $\overline{\text{RESET}}$ is asserted low, the DSP is initialized and placed in the Reset state. A Schmitt trigger input is used for noise immunity. When the $\overline{\text{RESET}}$ signal is deasserted, the initial chip operating mode is latched from MODA and MODB. The internal reset signal is deasserted synchronously with the internal clocks.</p>

CAUTION

DO NOT APPLY 10 VOLTS TO ANY PIN OF THE DSP56001A (including MODB)! Subjecting any pin of the DSP56001A to voltages in excess of the specified TTL/CMOS levels will permanently damage the device.

HOST INTERFACE (HI) PORT
Table 1-9 HI Signals

Signal Name	Signal Type	State during Reset	Signal Description
H0–H7	Input/Output	Tri-stated	<p>Host Data Bus (H0–H7)—This data bus transfers data between the host processor and the DSP56001A. When configured as a Host Interface port, the H0–H7 signals are tri-stated as long as $\overline{\text{HEN}}$ is deasserted. The signals are inputs unless $\text{HR}/\overline{\text{W}}$ is high and $\overline{\text{HEN}}$ is asserted, in which case H0–H7 become outputs, allowing the host processor to read the DSP56001A data. H0–H7 become outputs when $\overline{\text{HACK}}$ is asserted during $\overline{\text{HREQ}}$ assertion.</p>
PB0–PB7	Input or Output		<p>Port B GPIO 0–7 (PB0–PB7)—These signals are GPIO signals (PB0–PB7) when the Host Interface is not selected.</p> <p>After reset, the default state for these signals is GPIO input.</p>
HA0–HA2	Input	Tri-stated	<p>Host Address 0 – Host Address 2 (HA0–HA2)—These inputs provide the address selection for each Host Interface register.</p>
PB8–PB10	Input or Output		<p>Port B GPIO 8–10 (PB8–PB10)—These signals are GPIO signals (PB8–PB10) when the Host Interface is not selected.</p> <p>After reset, the default state for these signals is GPIO input.</p>
$\text{HR}/\overline{\text{W}}$	Input	Tri-stated	<p>Host Read/Write—This input selects the direction of data transfer for each host processor access. If $\text{HR}/\overline{\text{W}}$ is high and $\overline{\text{HEN}}$ is asserted, H0–H7 are outputs and DSP data is transferred to the host processor. If $\text{HR}/\overline{\text{W}}$ is low and $\overline{\text{HEN}}$ is asserted, H0–H7 are inputs and host data is transferred to the DSP. $\text{HR}/\overline{\text{W}}$ must be stable when $\overline{\text{HEN}}$ is asserted.</p>
PB11	Input or Output		<p>Port B GPIO 11 (PB11)—This signal is a GPIO signal called PB11 when the Host Interface is not being used.</p> <p>After reset, the default state for this signal is GPIO input.</p>

Table 1-9 HI Signals (Continued)

Signal Name	Signal Type	State during Reset	Signal Description
$\overline{\text{HEN}}$	Input	Tri-stated	<p>Host Enable—This input enables a data transfer on the host data bus. When $\overline{\text{HEN}}$ is asserted and $\text{HR}/\overline{\text{W}}$ is high, H0–H7 become outputs and the host processor may read DSP56001A data. When $\overline{\text{HEN}}$ is asserted and $\text{HR}/\overline{\text{W}}$ is low, H0–H7 become inputs. Host data is latched in the DSP on the rising edge of $\overline{\text{HEN}}$. Normally, a chip select signal derived from host address decoding and an enable strobe are used to generate $\overline{\text{HEN}}$.</p>
PB12	Input or Output		<p>Port B GPIO 12 (PB12)—This signal is aGPIO signal called PB12 when the Host Interface is not being used.</p> <p>After reset, the default state for this signal is GPIO input.</p>
$\overline{\text{HREQ}}$	Open drain Output	Tri-stated	<p>Host Request—This signal is used by the Host Interface to request service from the host processor, DMA controller, or a simple external controller.</p> <p>Note: $\overline{\text{HREQ}}$ should always be pulled high when it is not in use.</p>
PB13	Input or Output		<p>Port B GPIO 13 (PB13)—This signal is a GPIO (not open-drain) signal (PB13) when the Host Interface is not selected.</p> <p>After reset, the default state for this signal is GPIO input.</p>
$\overline{\text{HACK}}$	Input	Tri-stated	<p>Host Acknowledge—This input has two functions. It provides a host acknowledge handshake signal for DMA transfers and it receives a host interrupt acknowledge compatible with MC68000 family processors.</p> <p>Note: $\overline{\text{HACK}}$ should always be pulled high when it is not in use.</p>
PB14	Input or Output		<p>Port B GPIO 14 (PB14)—This signal is a GPIO signal (PB14) when the Host Interface is not selected, and may be programmed as a GPIO signal when the Host Interface is selected.</p> <p>After reset, the default state for this signal is GPIO input.</p>

SERIAL COMMUNICATIONS INTERFACE PORT
Table 1-10 Serial Communications Interface (SCI) Signals

Signal Name	Signal Type	State during Reset	Signal Description
RXD	Input	Tri-stated	Receive Data (RXD) —This input receives byte-oriented data and transfers the data to the SCI receive shift register. Input data can be sampled on either the positive edge or on the negative edge of the receive clock, depending on how the SCI control register is programmed.
PC0	Input or Output		Port C GPIO 0 (PC0) —This signal is a GPIO signal called PC0 when the SCI RXD function is not being used. After reset, the default state is GPIO input.
TXD	Output	Tri-stated	Transmit Data (TXD) —This output transmits serial data from the SCI transmit shift register. In the default configuration, the data changes on the positive clock edge and is valid on the negative clock edge. The user can reverse this clock polarity by programming the SCI control register appropriately.
PC1	Input or Output		Port C GPIO 1 (PC1) —This signal is a GPIO signal called PC1 when the SCI TXD function is not being used. After reset, the default state is GPIO input.
SCLK	Input/ Output	Tri-stated	SCI Clock (SCLK) —This signal provides an input or output clock from which the transmit/receive baud rate is derived in the Asynchronous mode, and from which data is transferred in the Synchronous mode. The direction and function of the signal is defined by the RCM bit in the SCI Clock Control Register (SCCR).
PC2	Input or Output		Port C GPIO 2 (PC2) —This signal is a GPIO signal called PC2 when the SCI TCLK function is not being used. After reset, the default state is GPIO input.

SYNCHRONOUS SERIAL INTERFACE PORT

Table 1-11 Synchronous Serial Interface (SSI) Signals

Signal Name	Signal Type	State during Reset	Signal Description
SC0 PC3	Input or Output Input or Output	Tri-stated	<p>Serial Clock 0 (SC0)—This signal's function is determined by whether the SCLK is in Synchronous or Asynchronous mode.</p> <ul style="list-style-type: none"> In Synchronous mode, this signal is used as a serial I/O flag. In Asynchronous mode, this signal receives clock I/O. <p>Port C GPIO 3 (PC3)—This signal is GPIO signal PC3 when not configured as SCI signal SC0.</p> <p>After reset, the default state is GPIO input.</p>
SC1 PC4	Input or Output Input or Output	Tri-stated	<p>Serial Clock 1 (SC1)—The SSI uses this bidirectional signal to control flag or frame synchronization. This signal's function is determined by whether the SCLK is in Synchronous or Asynchronous mode.</p> <ul style="list-style-type: none"> In Asynchronous mode, this signal is frame sync I/O. For Synchronous mode with continuous clock, this signal is a serial I/O flag and operates like the SC0. <p>SC0 and SC1 are independent serial I/O flags, but may be used together for multiple serial device selection.</p> <p>Port C GPIO 4 (PC4)—This signal is GPIO signal PC4 when not configured as SSI function SC1.</p> <p>After reset, the default state is GPIO input.</p>
SC2 PC5	Input or Output Input or Output	Tri-stated	<p>Serial Clock 2 (SC2)—The SSI uses this bidirectional signal to control frame synchronization only. As with SC0 and SC1, its function is defined by the SSI operating mode.</p> <p>Port C GPIO 5 (PC5)—This signal is GPIO signal PC5 when not configured as SSI function SC1.</p> <p>After reset, the default state is GPIO input.</p>
SCK PC6	Input or Output Input or Output	Tri-stated	<p>SSI Serial Receive Clock—This bidirectional signal provides the serial bit rate clock for the SSI when only one clock is being used.</p> <p>Port C GPIO 6 (PC6)—This signal is GPIO signal PC6 when the SSI function is not being used.</p> <p>After reset, the default state is GPIO input.</p>

Table 1-11 Synchronous Serial Interface (SSI) Signals (Continued)

Signal Name	Signal Type	State during Reset	Signal Description
SRD	Input	Tri-stated	SSI Receive Data —This input signal receives serial data and transfers the data to the SSI Receive Shift Register.
PC7	Input or Output		Port C GPIO 7 (PC7) —This signal is GPIO signal PC7 when the SSI SRD function is not being used. After reset, the default state is GPIO input.
STD	Output	Tri-stated	SSI Transmit Data (STD) —This output signal transmits serial data from the SSI Transmitter Shift Register.
PC8	Input or Output		Port C GPIO 8 (PC8) —This signal is GPIO signal PC8 when the SSI STD function is not being used. After reset, the default state is GPIO input.

SECTION 2

SPECIFICATIONS

GENERAL CHARACTERISTICS

The DSP56001A is fabricated in high-density HCMOS with TTL compatible inputs and outputs.

Table 2-1 Absolute Maximum Ratings (GND = 0 V)

Rating	Symbol	Value	Unit
Supply Voltage	V_{CC}	-0.3 to +7.0	V
All Input Voltages	V_{IN}	(GND - 0.5) to ($V_{CC} + 0.5$)	V
Current Drain per Pin excluding V_{CC} and GND	I	10	mA
Storage Temperature	T_{stg}	-55 to +150	°C

Note: This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (e.g., either GND or V_{CC}).

Table 2-2 Recommended Operating Conditions

Rating	Symbol	Value	Unit
Supply Voltage	V_{CC}	4.5 to 5.5	V
Operating Temperature Range (See Note 1)	T_A	-40 to +105	°C

Table 2-3 Thermal Characteristics for 88-pin PGA Package

Thermal Resistance	Symbol	Value	Rating
Junction to Ambient (See Note 2)	$R_{\theta JA}$	27	°C/W
Junction to Case (estimated) (See Note 3)	$R_{\theta JC}$	6.5	°C/W

General Characteristics

Table 2-4 Thermal Characteristics for 132-pin CQFP/PQFP Packages

Thermal Resistance	Symbol	Value	Rating
Junction to Ambient	$R_{\theta JA}$	40 (CQFP) 47 (PQFP)	°C/W
Junction to Case (estimated)	$R_{\theta JC}$	7.0 (CQFP) 13.0 (PQFP)	°C/W
Note: <ol style="list-style-type: none"> See discussion under Design Considerations, Heat Dissipation, page 4-1. Junction-to-ambient thermal resistance is based on measurements on a horizontal single-sided Printed Circuit Board per SEMI G38-87 in natural convection. SEMI is Semiconductor Equipment and Materials International, 805 East Middlefield Road, Mountain View, CA 94043, (415) 964-5111. Junction-to-case thermal resistance is based on measurements using a cold plate per SEMI G30-88 with the exception that the cold plate temperature is used for the case temperature. 			

DC ELECTRICAL CHARACTERISTICS
Table 2-5 DC Electrical Characteristics

Characteristics	Symbol	Min	Typ	Max	Units
Supply Voltage 27 MHz 33 MHz	V_{CC}	4.5 4.75	5.0 5.0	5.5 5.25	V V
Input High Voltage • EXTAL • $\overline{\text{RESET}}$ • MODA, MODB • All other inputs	V_{IHC} V_{IHR} V_{IHM} V_{IH}	4.0 2.5 3.5 2.0	— — — —	V_{CC} V_{CC} V_{CC} V_{CC}	V V V V
Input Low Voltage • EXTAL • MODA, MODB • All other inputs	V_{ILC} V_{ILM} V_{IL}	-0.5 -0.5 -0.5	— — —	0.6 2.0 0.8	V V V
Input Leakage Current EXTAL, $\overline{\text{RESET}}$, MODA/ $\overline{\text{IRQA}}$, MODB/ $\overline{\text{IRQB}}$, $\overline{\text{DR}}$, $\overline{\text{BR/WT}}$	I_{IN}	-1	—	1	μA

Note:	1. Section 4 Design Considerations describes how to calculate the external supply current. 2. In order to obtain these results all inputs must be terminated (i.e., not allowed to float). 3. Periodically sampled and not 100% tested				

AC ELECTRICAL CHARACTERISTICS

The timing waveforms in the AC Electrical Characteristics are tested with a V_{IL} maximum of 0.5 V and a V_{IH} minimum of 2.4 V for all pins, except EXTAL, \overline{RESET} , MODA, and MODB. These pins are tested using the input levels set forth in the DC electrical characteristics. AC timing specifications that are referenced to a device input signal are measured in production with respect to the 50% point of the respective input signal's transition. DSP56001A output levels are measured with the production test machine V_{OL} and V_{OH} reference levels set at 0.8 V and 2.0 V, respectively.

Note: The midpoint is $V_{IL} + (V_{IH} - V_{IL})/2$.

INTERNAL CLOCKS

For each occurrence of T_H , T_L , T_C or I_{CYC} , substitute with the numbers in Table 2-6.

Table 2-6 Internal Clocks

Characteristics	Symbol	Expression
Internal Operation Frequency	f	
Internal Clock High Period	T_H	ET_H
Internal Clock Low Period	T_L	ET_L
Internal Clock Cycle Time	T_C	ET_C
Instruction Cycle Time	I_{CYC}	$2 \times T_C$

EXTERNAL CLOCK (EXTAL PIN)

The DSP56001A system clock may be derived from the on-chip crystal oscillator as shown in **Figure 2-2**, or it may be externally supplied. An externally supplied square wave voltage source should be connected to EXTAL, leaving XTAL physically unconnected to the board or socket. The rise and fall times of this external clock should be 4 ns maximum.

**Fundamental Frequency
Crystal Oscillator**

Suggested Component Values
 R = 680 kΩ ± 10%
 C = 20 pf ± 20%

- Note:
1. The suggested crystal source is ICM, # 433163 – 4.00 (4 MHz fundamental, 20 pf load) or # 436163 – 30.00 (30 MHz fundamental, 20 pf load)
 2. To reduce system cost, a ceramic resonator may be used instead of the crystal. Suggested source: Murata-Erie #CST4.00MGW040 (4 MHz with built-in load capacitors)

**3rd Overtone
Crystal Oscillator**

Suggested Component Values
 R1 = 470 kΩ ± 10%
 R2 = 330 Ω ± 10%
 C1 = 0.1 μf ± 20%
 C2 = 26 pf ± 20%
 C3 = 20 pf ± 10%
 L1 = 2.37 μH ± 10%
 XTAL = 33 MHz, AT cut, 20 pf load,
 50 Ω max series resistance

- Note:
1. 3rd overtone crystal
 2. The suggested crystal source is ICM, # 471163 – 33.00 (33 MHz 3rd overtone, 20 pf load)
 3. R2 limits crystal current

28	Delay from Level-Sensitive $\overline{\text{IRQA}}$ Assertion to Fetch of First Interrupt Instruction (when exiting 'Stop') (See Note 1) <ul style="list-style-type: none"> • Internal Crystal Oscillator Clock, OMR Bit 6 = 0 • Stable External Clock, OMR Bit 6 = 1 	65548 × T _C	—	65548 × T _C	—	ns
		20 × T _C	—	20 × T _C	—	ns
Note: <ol style="list-style-type: none"> 1. A clock stabilization delay is required when using the on-chip crystal oscillator in two cases: <ul style="list-style-type: none"> • after power-on reset, and • when recovering from Stop mode. During this stabilization period, T_C, T_H, and T_L will not be constant. Since this stabilization period varies, a delay of 75,000 × T_C is typically allowed to assure that the oscillator is stable before executing programs. While it is possible to set OMR Bit 6 = 1 when using the internal crystal oscillator, it is not recommended and these specifications do not guarantee timings for that case. 2. Circuit stabilization delay is required during reset when using an external clock in two cases: <ul style="list-style-type: none"> • after power-on reset, and • when recovering from Stop mode. 3. When using fast interrupts and $\overline{\text{IRQA}}$ and $\overline{\text{IRQB}}$ are defined as level-sensitive, then timings 19 through 22 apply to prevent multiple interrupt service. To avoid these timing restrictions, the deasserted Edge-Triggered mode is recommended when using fast interrupt. Long interrupts are recommended when using Level-Sensitive mode.

48	Delay from \overline{HEN} Deassertion to \overline{HREQ} Assertion for TXL Write (See Notes 5, 6)	$t_{HSDL} + T_C + 4$	—	$t_{HSDL} + T_C + 4$	—	ns
49	Delay from \overline{HEN} Assertion to \overline{HREQ} Deassertion for RXL Read, TXL Write (See Notes 5, 6)	4	70	4	65	ns
Note:	1. Host synchronization delay (t_{HSDL}) is the time period required for the DSP56001 to sample any external asynchronous input signal, determine whether it is high or low, and synchronize it to the DSP56001 internal clock. 2. See Host Port Considerations in the section on Design Considerations . 3. This timing must be adhered to only if two consecutive writes to the TXL are executed without polling TXDE or \overline{HREQ} . 4. This timing must be adhered to only if two consecutive reads from one of these registers are executed without polling the corresponding status bits or \overline{HREQ} . 5. \overline{HREQ} is pulled up by a 1 k Ω resistor. 6. Specifications are periodically sampled and not 100% tested. 7. May decrease to 0 ns for future versions.

106	Flag Output Valid After TXC Rising Edge	— —	54 31	— —	43 25	x ck i ck	ns ns
Note: 1. For internal clock, External Clock Cycle is defined by I_{cyc} and SSI control register. 2. Periodically sampled and not 100% tested							

Note: In the Network mode, output flag transitions can occur at the start of each time slot within the frame. In the Normal mode, the output flag state is asserted for the entire frame period.

AA0894

Figure 2-19 SSI Transmitter Timing

Note: In the Network mode, output flag transitions can occur at the start of each time slot within the frame. In the Normal mode, the output flag state is asserted for the entire frame period.

Figure 2-20 SSI Receiver Timing

EXTERNAL BUS ASYNCHRONOUS TIMING
 $V_{CC} = 5.0\text{ V} \pm 10\%$ for 27 MHz; $V_{CC} = 5.0\text{ V} \pm 5\%$ for 33 MHz;

 $T_J = -40$ to $105\text{ }^\circ\text{C}$; $C_L = 50\text{ pF} + 1\text{ TTL loads}$

WS = Number of Wait States, as determined by BCR (WS = 0 to 15)

Capacitance Derating: The DSP56001A external bus timing specifications are designed and tested at the maximum capacitive load of 50 pF, including stray capacitance. Typically, the drive capability of the external bus pins (A0-A15, D0-D23, $\overline{\text{PS}}$, $\overline{\text{DS}}$, $\overline{\text{RD}}$, $\overline{\text{WR}}$, X/Y) derates linearly at 1 ns per 12 pF of additional capacitance from 50 pF to 250 pF of loading. Port B and C pins (HI, SCI, SSI) derate linearly at 1 ns per 5 pF of additional capacitance from 50 pF to 250 pF of loading. Active low lines should be pulled up in a manner consistent with the AC and DC specifications.

Table 2-13 External Bus Asynchronous Timing

No.	Characteristics	27 MHz		33 MHz		Unit
		Min	Max	Min	Max	
115	Delay from $\overline{\text{BR}}$ Assertion to $\overline{\text{BG}}$ Assertion					
	• With no external access from the DSP	$2 \times T_C + T_H$	$4 \times T_C + T_H + 15$	$2 \times T_C + T_H$	$4 \times T_C + T_H + 13$	ns
	• During external read or write access	$T_C + T_H$	$4 \times T_C + T_H + T_C \times \text{WS} + 15$	$T_C + T_H$	$4 \times T_C + T_H + T_C \times \text{WS} + 13$	ns
	• During external read-modify-write access	$T_C + T_H$	$6 \times T_C + T_H + 2 \times T_C \times \text{WS} + 15$	$T_C + T_H$	$6 \times T_C + T_H + 2 \times T_C \times \text{WS} + 13$	ns
	• During Stop mode—external bus will not be released and $\overline{\text{BG}}$ will not go low	—	—	—	—	ns
• During Wait mode	$T_H + 3$	$T_C + T_H + 23$	$T_H + 3$	$T_C + T_H + 19$	ns

145	Clk Low transition to Data-Out Valid	—	19	—	19	ns
146	Clk Low transition to Data-Out Invalid (See Note 3)	4	—	3.5	—	ns
147	Data-In Valid to Clk High transition (Setup)	4	—	4	—	ns
148	Clk High transition to Data-In Invalid (Hold)	12	—	12	—	ns
149	Clk Low transition to Address Invalid (See Note 3)	2	—	2	—	ns

Table 2-14 External Bus Synchronous Timing (Continued)

Num	Characteristics	27 MHz		33 MHz		Unit
		Min	Max	Min	Max	
Note: 1. AC timing specifications which are referenced to a device input signal are measured in production with respect to the 50% point of the respective input signal's transition. 2. WS are wait state values specified in the BCR. 3. Clk Low transition to data-out invalid (specification # T146) and Clk Low transition to address invalid (specification # T149) indicate the time after which data/address are no longer guaranteed to be valid. 4. Timings are given from Clk midpoint to V_{OL} or V_{OH} of the corresponding signal(s).						

Note: During Read-Modify-Write Instructions, the address lines do not change states. AA0395

Figure 2-23 Synchronous Bus Timing

BUS STROBE / WAIT TIMING

$V_{CC} = 5.0 \text{ V} \pm 10\%$ for 27 MHz; $V_{CC} = 5.0 \text{ V} \pm 5\%$ for 33 MHz;
 $T_J = -40 \text{ to } 105^\circ \text{ C}$; $C_L = 50 \text{ pF} + 2 \text{ TTL loads}$

159	Minimum \overline{BS} Deassertion Width for Consecutive External Accesses	$T_H - 6$	—	$T_H - 4.5$	—	ns
160	\overline{BS} Deassertion to Address Invalid (See Note 2)	$T_H - 8$	—	$T_H - 6.5$	—	ns

Table 2-15 Bus Strobe / Wait Timing (Continued)

No.	Characteristics	27 MHz		33 MHz		Unit
		Min	Max	Min	Max	
161	Data-In Valid to \overline{RD} Deassertion (Set Up)	12	—	10	—	ns

Note:

1. If wait states are also inserted using the BCR and if the number of wait states is greater than two, then specification numbers T156 and T157 can be increased accordingly.
2. \overline{BS} deassertion to address invalid indicates the time after which the address are no longer guaranteed to be valid.
3. The minimum number of wait states when using $\overline{BS}/\overline{WT}$ is two (2).
4. For read-modify-write instructions, the address lines will not change states between the read and the write cycle. However, \overline{BS} will deassert before asserting again for the write cycle. If wait states are desired for each of the read and write cycle, the \overline{WT} pin must be asserted once for each cycle.

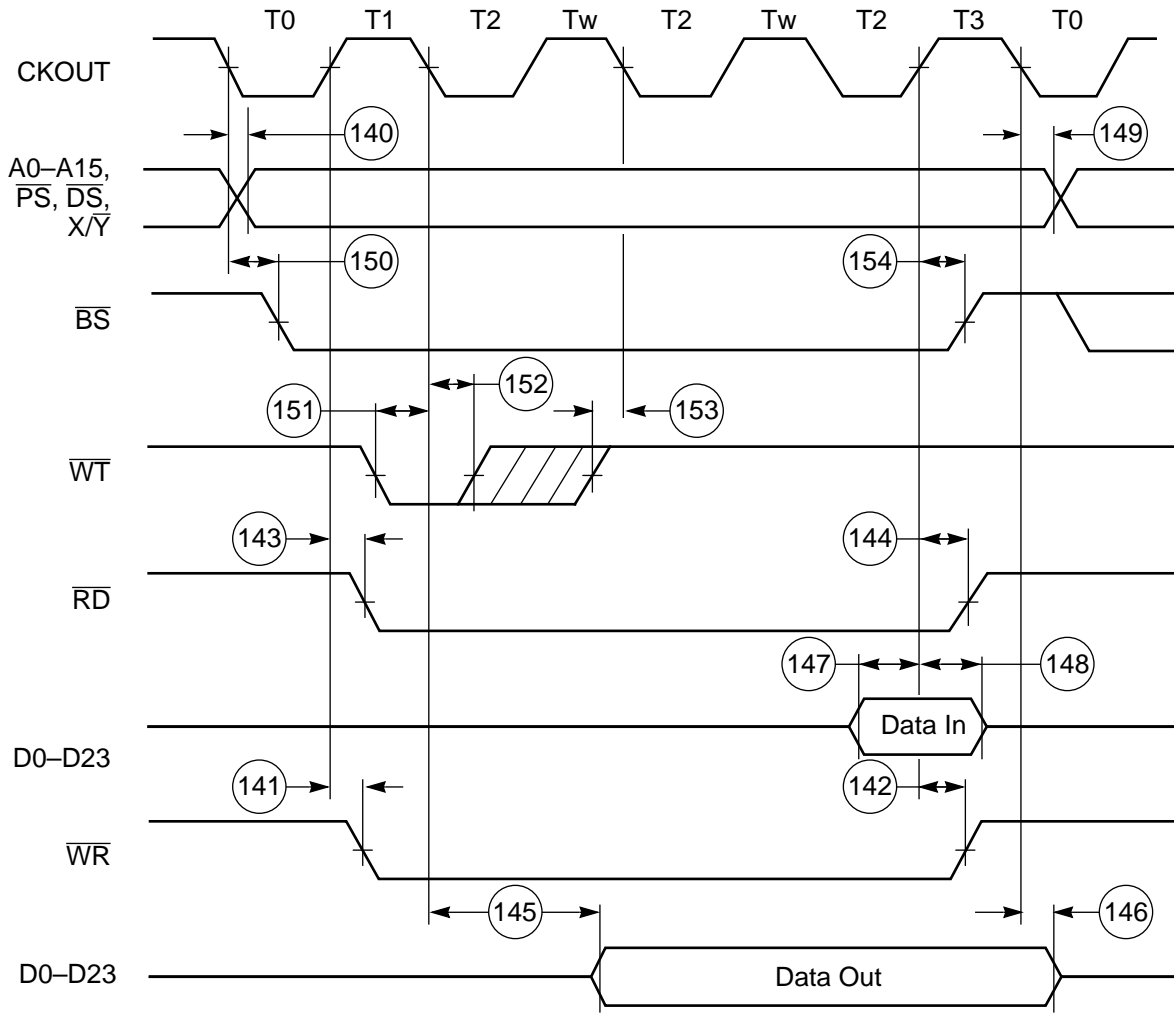

Note: During Read-Modify-Write instructions, the address lines do not change state. However, \overline{BS} will deassert before asserting again for the write cycle.

AA0398

Figure 2-24 Asynchronous \overline{BS} / \overline{WT} Timings

Bus Strobe / Wait Timing

Note: During Read-Modify-Write Instructions, the address lines do not change state. However, \overline{BS} will deassert before asserting again for the write cycle.

SECTION 3

PACKAGING

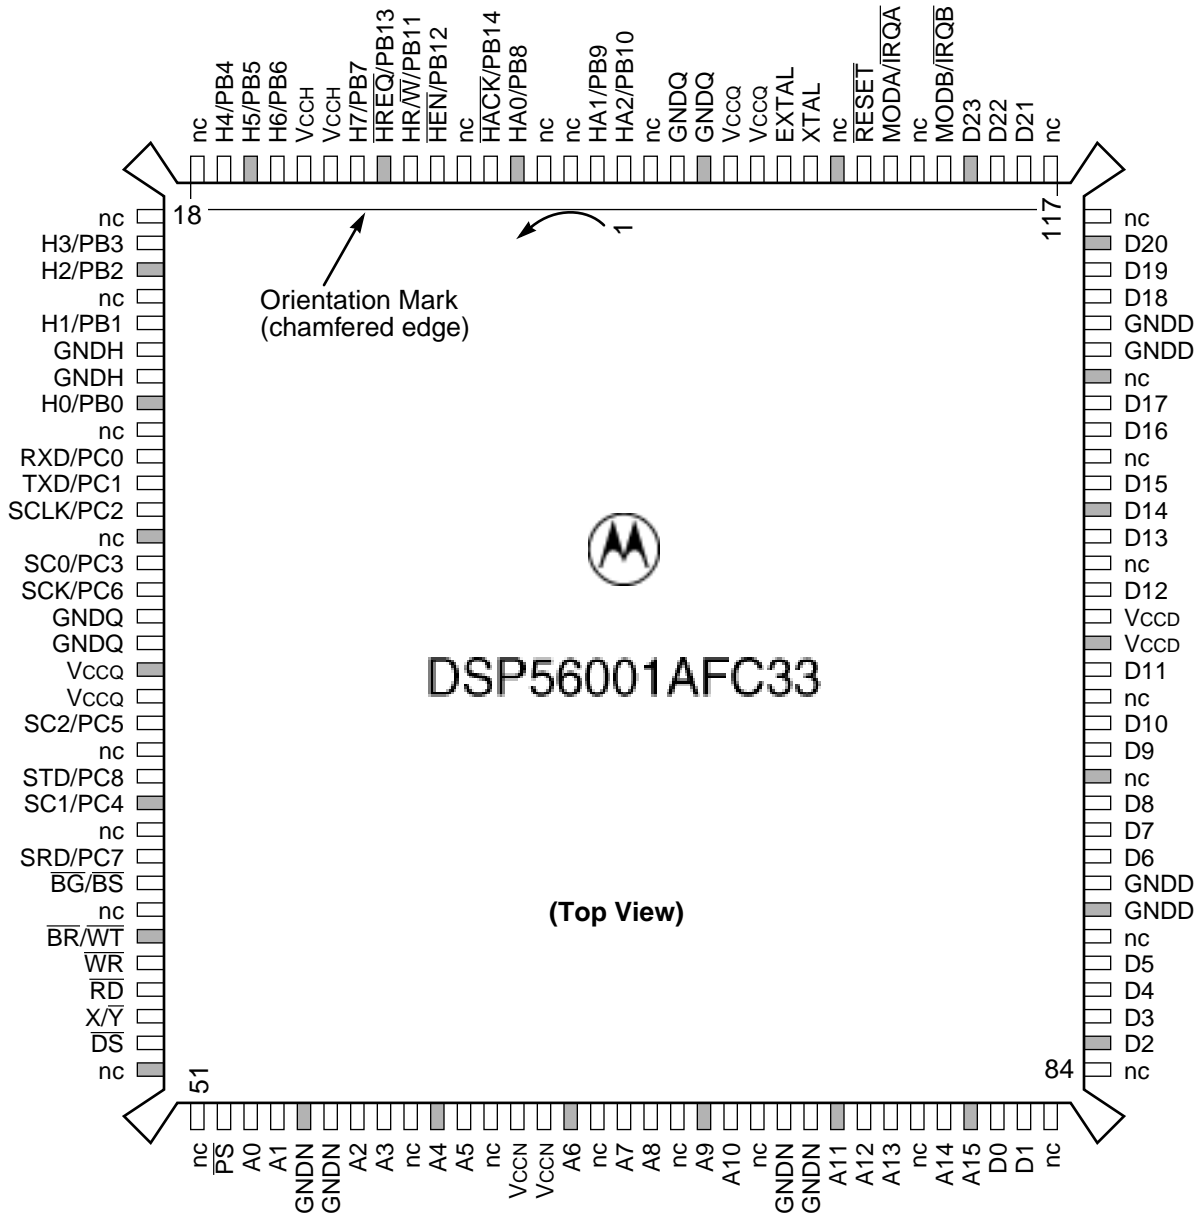

PIN-OUT AND PACKAGE INFORMATION

This section supplies information about the packages which are available for this product. Diagrams of the pinouts of each package are included, and tables describing the pins allocated to each of the signals described in **Table 3-1** through **Table 3-5**.

The DSP56001A is available in 3 packages:

- 132-pin plastic quad flat pack (PQFP), type 'FC'
- 132-pin ceramic quad flat pack (CQFP), type 'FE'
- 88-pin Pin Grid Array (PGA), type 'RC'

Top and bottom views of the each package are shown, together with their pin-outs.

- Note:
1. "nc" are no connection pins that are reserved for possible future enhancements. Do not connect these pins to any power, ground, signal traces, or vias.
 2. An $\overline{\text{O}}$ VERBAR indicates the signal is asserted when the voltage = ground (active low).
 3. To simplify locating the pins, each fifth pin is shaded in the illustration.

AA0898

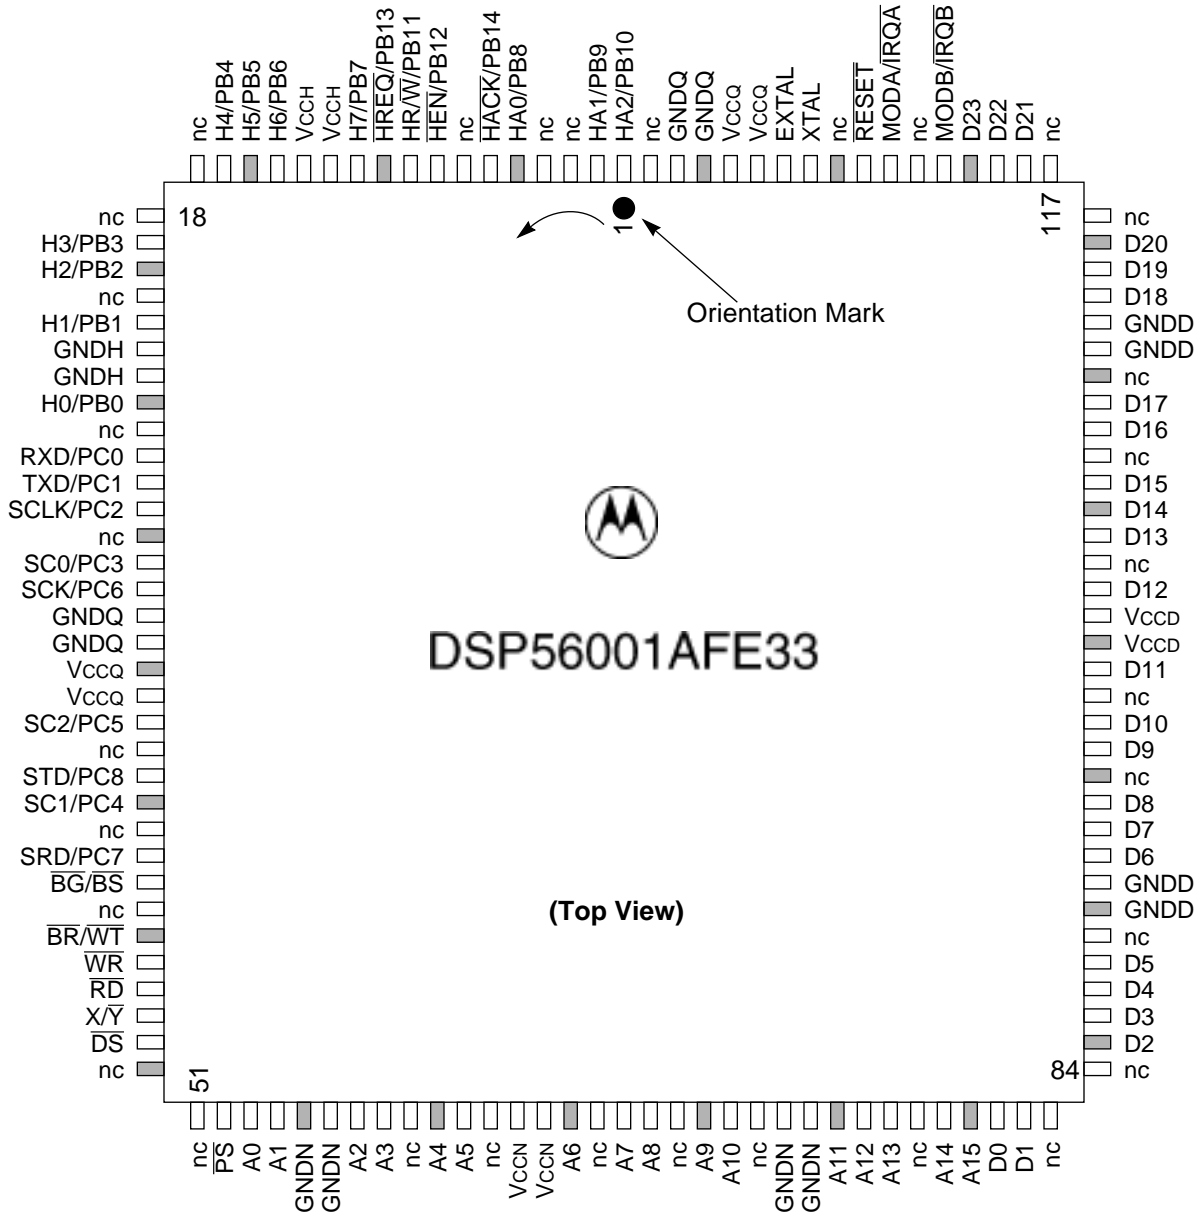

Figure 3-1 Top View of the 132-pin Plastic (FC) Quad Flat Package

- Note:
1. "nc" are no connection pins that are reserved for possible future enhancements. Do not connect these pins to any power, ground, signal traces, or vias.
 2. An OVERBAR indicates the signal is asserted when the voltage = ground (active low).
 3. To simplify locating the pins, each fifth pin is shaded in the illustration.

AA0899

SECTION 4

DESIGN CONSIDERATIONS

SUBSTITUTING THE DSP56001A FOR THE DSP56001

This section highlights the differences between the DSP56001 and DSP56001A that need to be taken into consideration when substituting the DSP56001A for the DSP56001. New designs should use the DSP56002 due to its enhanced features and speed.

Hardware Considerations

NON-MASKABLE INTERRUPT (NMI)

A Non-Maskable Interrupt (NMI) function was previously accessible on the DSP56001 by applying 10 volts to the MODB/ $\overline{\text{IRQB}}$ pin. The DSP56001A does not support a non-maskable interrupt (NMI).

CAUTION

DO NOT APPLY 10 VOLTS TO ANY PIN OF THE DSP56001A (including MODB)! Subjecting any pin of the DSP56001A to voltages in excess of the specified TTL/CMOS levels will permanently damage the device.

AC ELECTRICAL CHARACTERISTICS

The DSP56001A die utilizes a faster technology than the DSP56001. As a result, many DSP56001A signals exhibit faster rise and fall times than the same signals on the DSP56001. These faster edges may generate more radiated noise and EMI, and may require more attention to these issues (e.g., the DSP56001A based circuit may require better decoupling).

Software/Application Considerations

Software written for the DSP56001 will generally run unmodified on the DSP56001A. There are, however, certain differences which should be noted. Users should consider the impact these differences may have on each application.

AGU MODIFY REGISTERS

Numbers between \$8000 and \$FFFE (inclusive) are not valid values for loading into the modify registers (M0–M7) of the address generation unit on the DSP56001. Certain values within this range, however, enable wrap-around addressing modes on the DSP56001A that are not supported, and inadvertent enabling of these addressing modes may yield unexpected results. Do **not** load the modify registers of the DSP56001A with values from \$8000 to \$FFFE.

RESERVED MEMORY LOCATIONS

Certain memory locations are designated as reserved on the DSP56001. Accesses to these memory locations on the DSP56001A will result in unpredictable processor behavior **including the possibility of halting the processor completely**. In particular, writes to the following X memory locations should be avoided on the DSP56001A:

X:\$FFDE, X:\$FFDF, X:\$FFFC, X:\$FFFD

MOVEP TO RN/NN/MN REGISTERS

On the DSP56001 there is a pipeline delay when using the MOVEP instruction to change the contents of an address register (Mn, Nn, or Rn). The new contents of the destination address register will not be available for use during the following instruction (i.e, there is a single instruction cycle delay).

On the DSP56001A this pipeline delay has been removed. If an address register (Mn, Nn, or Rn) is directly changed with a MOVEP instruction, the updated contents will be available for use during the following instruction. DSP56001 software that depends on this pipeline delay must be modified when moved onto the DSP56001A.

MOVEP TO/FROM DATA ALU REGISTERS

MOVEP instructions to/from Data ALU registers take 2 instruction cycles on the DSP56001. On the DSP56001A, these instructions take only 1 instruction cycle. DSP56001 software which is dependent on the timing of this form of the MOVEP instruction must be modified when ported to the DSP56001A.

Table 4-1 Illegal Instructions

Instruction Symbol	Instruction Name
DEBUG—DO NOT USE	Enter Debug mode
DEBUGcc—DO NOT USE	Enter Debug mode conditionally
DEC	Decrement by one
INC	Increment by one
MAC #iiii	Signed multiply-accumulate immediate
MPY #iiii	Signed multiply immediate
MACR #iiii	Signed multiply-accumulate and round immediate
MPYR #iiii	Signed multiply and round immediate

MOVEP IMMEDIATE

MOVEP Immediate instructions take 3 instruction cycles on the DSP56001. On the DSP56001A, these instructions take only 2 instruction cycles. DSP56001 software that is dependent on the timing of this form of the MOVEP instruction must be modified when ported to the DSP56001A.

ILLEGAL INSTRUCTIONS

The instructions listed in **Table 4-1** will *not* generate an illegal instruction interrupt on the DSP56001A. None of these instructions are tested on the DSP56001A and should *not* be used.

Note: The DEBUG and DEBUGcc instructions are microcoded on the DSP56001A, but the peripherals necessary to make use of this instruction are not available. Any use of the DEBUG or DEBUGcc instructions will completely halt the processor. The processor will exit this state only on reset.

STOP/WAIT TIMING

Wake-up from the Stop and Wait operating modes with \overline{IRQA} and \overline{IRQB} is longer on the DSP56001A by one Tc period.

SCI/SSI INITIALIZATION TIMING

On the DSP56001A, the SCI and SSI clocks are stopped when the peripherals are not enabled in order to save power. As a result, the initialization time of the SCI and SSI is longer on the DSP56001A than on the DSP56001.

CONTROL REGISTERS

The OMR and the Status Register on the DSP56001A have been altered from those on the DSP56001. Refer to **Table 4-2** for details of these alterations.

Table 4-2 Summary of Control Register Differences

REGISTER	BIT	DSP56001 DEFINITION	DSP56001A DEFINITION	EXPLANATION OF DIFFERENCE
Status Register	7	Reserved— Read/Written as zero.	Reserved— Read as don't care.	On the 001A this bit may be read as 0 or 1. The user should not rely on this bit being a given value.
	14	Reserved— Read/Written as zero.	Reserved— Write as zero only, read as don't care.	If this bit is set on the 56001A, the operations performed by the Data ALU change, and 56001 code will yield erroneous results. Write this bit only as zero.
Operating Mode Register	3	Reserved— Read/Written as zero	Reserved— Write as zero only, read as don't care.	If this bit is set, memory reads may be from incorrect locations. Write this bit only as zero.
Port B Control Register	1	Reserved— Written as zero.	Reserved— Written as zero.	Writing this bit as a 1 will result in behavior differences between the 001 and the 001A.

HOST COMMAND VECTOR REGISTER

The DSP56001A's Host Command Vector Register (CVR) also differs from that of the DSP56001 (see **Table 4-3**).

Table 4-3 Summary of Host Command Vector Register Differences

REGISTER	BIT	DSP56001 DEFINITION	DSP56001A DEFINITION	EXPLANATION OF DIFFERENCE
Host Command Vector Register (CVR)	5	Reserved— Read as zero.	Reserved—Read as don't care.	This bit should be written with only a zero on the 56001A.

HEAT DISSIPATION

The average chip junction temperature, T_J , in °C, can be obtained from:

$$\text{Equation 1: } T_J = T_A + (P_D \times \Theta_{JA})$$

Where:

T_A = ambient temperature, °C

Θ_{JA} = package thermal resistance, junction-to-ambient, °C/W

$P_D = P_{INT} + P_{I/O}$

$P_{INT} = I_{CC} \times V_{CC}$ watt—chip internal power

$P_{I/O}$ = power dissipation on input and output pins—user determined

For most applications $P_{I/O} < P_{INT}$ and $P_{I/O}$ can be neglected. An appropriate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$\text{Equation 2: } P_D = K / (T_J + 273)$$

Solving equations (1) and (2) for K gives:

$$\text{Equation 3: } K = P_D \times (T_A + 273) + P_D \times \Theta_{JA}$$

Where: K is a constant pertaining to the particular package

K can be determined from equation (2) by measuring P_D (at equilibrium) for a known T_A . Using this value of K, the values of P_D and T_J can be obtained by solving equations (1) and (2) iteratively for any value of T_A . The total thermal resistance of a package (Θ_{JA}) can be separated into two components, Θ_{JC} and Θ_{CA} , representing the barrier to heat flow from the semiconductor junction to the package (case) surface (Θ_{JC}) and from the case to the outside ambient (Θ_{CA}). These terms are related by the equation:

$$\text{Equation 4: } \Theta_{JA} = \Theta_{JC} + \Theta_{CA}$$

Θ_{JC} is device-related and cannot be influenced by the user. However, Θ_{CA} is user-dependent and can be minimized by thermal management techniques such as heat sinks, ambient air cooling, and thermal convection. Thus, good thermal management can significantly reduce Θ_{CA} so that Θ_{JA} approximately equals Θ_{JC} . Values for thermal resistance presented in this document, unless estimated, were derived using the procedure described in Motorola Reliability Report 7843, "Thermal Resistance Measurement Method for MC68XX Microcomponent Devices", and are provided for design purposes only. Thermal measurements are complex and dependent on procedure and setup. User-derived values for thermal resistance may differ.

ELECTRICAL DESIGN CONSIDERATIONS

CAUTION

This device contains protective circuitry to guard against damage due to high static voltage or electrical fields. However, normal precautions are advised to avoid application of any voltages higher than maximum rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (e.g., either GND or V_{CC}).

Use the following list of recommendations to assure correct DSP operation:

- Provide a low-impedance path from the board power supply to each V_{CC} pin on the DSP, and from the board ground to each GND pin.
- Use at least four 0.1 μ F bypass capacitors positioned as close as possible to the four sides of the package to connect the V_{CC} power source to GND.
- Ensure that capacitor leads and associated printed circuit traces that connect to the chip V_{CC} and GND pins are less than 0.5 inch per capacitor lead.
- Use at least a four-layer Printed Circuit Board (PCB) with two inner layers for V_{CC} and GND.
- Because the DSP output signals have fast rise and fall times, PCB trace lengths should be minimal. This recommendation particularly applies to the address and data buses as well as the \overline{RD} , \overline{WR} , \overline{IRQA} , \overline{IRQB} , \overline{NMI} , \overline{HEN} , and \overline{HACK} pins.
- Consider all device loads, as well as parasitic capacitance due to PCB traces, when calculating capacitance. This is especially critical in systems with higher capacitive loads that could create higher transient currents in the V_{CC} and GND circuits.
- All inputs must be terminated (i.e., not allowed to float) using CMOS levels.

POWER CONSUMPTION

Power dissipation is a key issue in portable DSP applications. The following describes some factors that affect current consumption. Current consumption is described by the formula:

$$\text{Equation 5: } I = C \times V \times f$$

where :

- C = node/pin capacitance
- V = voltage swing
- f = frequency of node/pin toggle

For example, for an address pin loaded with a 50 pF capacitance and operating at 5.5V with a 33 MHz clock, toggling at its maximum possible rate (which is 8.25 MHz), the current consumption is:

$$\text{Equation 6: } I = 50 \times 10^{-12} \times 5.5 \times 8.25 \times 10^6 = 227 \text{ mA}$$

The maximum internal current value ($I_{CCI} - \text{max}$), reflects the maximum possible switching of the internal buses, which is not necessarily a real application case. The typical internal current value ($I_{CCI} - \text{typ}$) reflects the average switching of the internal buses.

The following steps are recommended for applications requiring very low current consumption:

1. Minimize external memory accesses; use internal memory accesses instead.
2. Minimize the number of pins that are switching.
3. Minimize the capacitive load on the pins.
4. Connect the unused inputs to pull-up or pull-down resistors.

HOST PORT CONSIDERATIONS

Careful synchronization is required when reading multi-bit registers that are written by another asynchronous system. This is a common problem when two asynchronous systems are connected. The situation exists in the Host Interface. The following paragraphs present considerations for proper operation.

Host Programming Considerations

UNSYNCHRONIZED READING OF RECEIVE BYTE REGISTERS

When reading receive byte registers, RXH or RXL, the host program should use interrupts or poll the RXDF flag, which indicates that data is available. This assures that the data in the receive byte registers will be stable.

OVERWRITING TRANSMIT BYTE REGISTERS

The host program should not write to the transmit byte registers, TXH or TXL, unless the TXDE bit is set, indicating that the transmit byte registers are empty. This guarantees that the transmit byte registers will transfer valid data to the HRX register.

SYNCHRONIZATION OF STATUS BITS FROM DSP TO HOST

HC, HREQ, DMA, HF3, HF2, TRDY, TXDE, and RXDF status bits are set or cleared from inside the DSP and read by the host processor (refer to the *User's Manual* for descriptions of these status bits). The host can read these status bits very quickly without regard to the clock rate used by the DSP, but the state of the bit could be changing during the read operation. Generally, this is not a system problem, since the bit will be read correctly in the next pass of any host polling routine. However, if the host asserts $\overline{\text{HEN}}$ for more than timing number 31, with a minimum cycle time of timing number 31 + 32, then these status bits are guaranteed to be stable. Exercise care when reading status bits HF3 and HF2 as an encoded pair. If the DSP changes HF3 and HF2 from 00 to 11, there is a small probability that the host could read the bits during the transition and receive 01 or 10 instead of 11. If the combination of HF3 and HF2 has significance, the host could read the wrong combination. Therefore, read the bits twice and check for consensus.

OVERWRITING THE HOST VECTOR

The host program should change the Host Vector register only when the Host Command bit (HC) is clear. This change will guarantee that the DSP interrupt control logic will receive a stable vector.

CANCELLING A PENDING HOST COMMAND EXCEPTION

The host processor may elect to clear the HC bit to cancel the host command exception request at any time before it is recognized by the DSP. Because the host does not know exactly when the exception will be recognized (due to exception processing synchronization and pipeline delays), the DSP may execute the host command exception after the HC bit is cleared. For these reasons, the HV bits must not be changed at the same time that the HC bit is cleared.

VARIANCE IN THE HOST INTERFACE TIMING

The Host Interface (HI) may vary. Therefore, a host which attempts to load (bootstrap) the DSP should first make sure that the part has completed its HI port programming (e.g., by setting the INIT bit in ICR then polling it and waiting it to be cleared, then reading the ISR or by writing the TREQ/RREQ together with the INIT and then polling INIT, ISR, and the $\overline{\text{HREQ}}$ pin).

DSP Programming Considerations

SYNCHRONIZATION OF STATUS BITS FROM HOST TO DSP

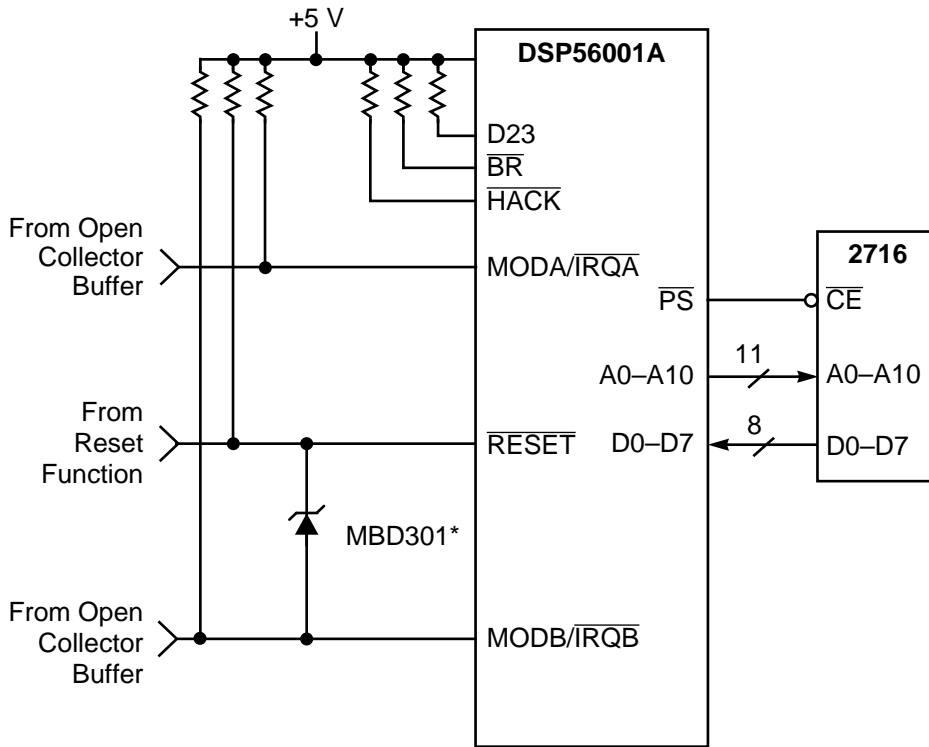

DMA, HF1, HF0, and HCP, HTDE, and HRDF status bits are set or cleared by the host processor side of the interface. These bits are individually synchronized to the DSP clock. (Refer to the *User's Manual* for descriptions of these status bits.)

READING HF0 AND HF1 AS AN ENCODED PAIR

Care must be exercised when reading status bits HF0 and HF1 as an encoded pair, because the four combinations (00, 01, 10, and 11) each have significance. A very small probability exists that the DSP will read the status bits during transition. Therefore, HF0 and HF1 should be read twice and checked for consensus.

APPLICATION EXAMPLES

The lowest cost DSP56001A-based system is shown in **Figure 4-1**. It uses no run time external memory and requires only two chips, the DSP56001A and a low cost EPROM. The EPROM read access time should be less than 780 nanoseconds when the DSP56001A is operating at a clock rate of 20.5 MHz.

- Note:
1. *These diodes **must** be Schottky diodes.
 2. All resistors are 15 K Ω unless noted otherwise.
 3. When in Reset, \overline{IRQA} and \overline{IRQB} must be deasserted by external peripherals.

AA0904

Figure 4-1 No Glue Logic, Low Cost Memory Port Bootstrap—Mode 1

A system with external data RAM memory requires no glue logic to select the external EPROM from Bootstrap mode. \overline{PS} is used to enable the EPROM and \overline{DS} is used to enable the high speed data memories, as shown in Figure 4-2.

- Note:
1. All resistors are 15 K Ω unless noted otherwise.
 2. When in Reset, \overline{IRQA} and \overline{IRQB} must be deasserted by external peripherals.

AA0905

Figure 4-2 Port A Bootstrap with External Data RAM—Mode 1

Figure 4-3 shows the DSP56001A bootstrapping via the Host Port from an MC68000.

- Note:
1. All resistors are 15 K Ω unless noted otherwise.
 2. When in Reset, \overline{IRQA} and \overline{IRQB} must be deasserted by external peripherals.

AA0906

Figure 4-3 DSP56001A Host Bootstrap Example—Mode 5

In **Figure 4-4**, the DSP56001A is operated in Mode 3 with external program memory and the reset vector at location \$0000. The programmer can overlay the high-speed on-chip Program RAM with DSP algorithms by using the MOVEM instruction.

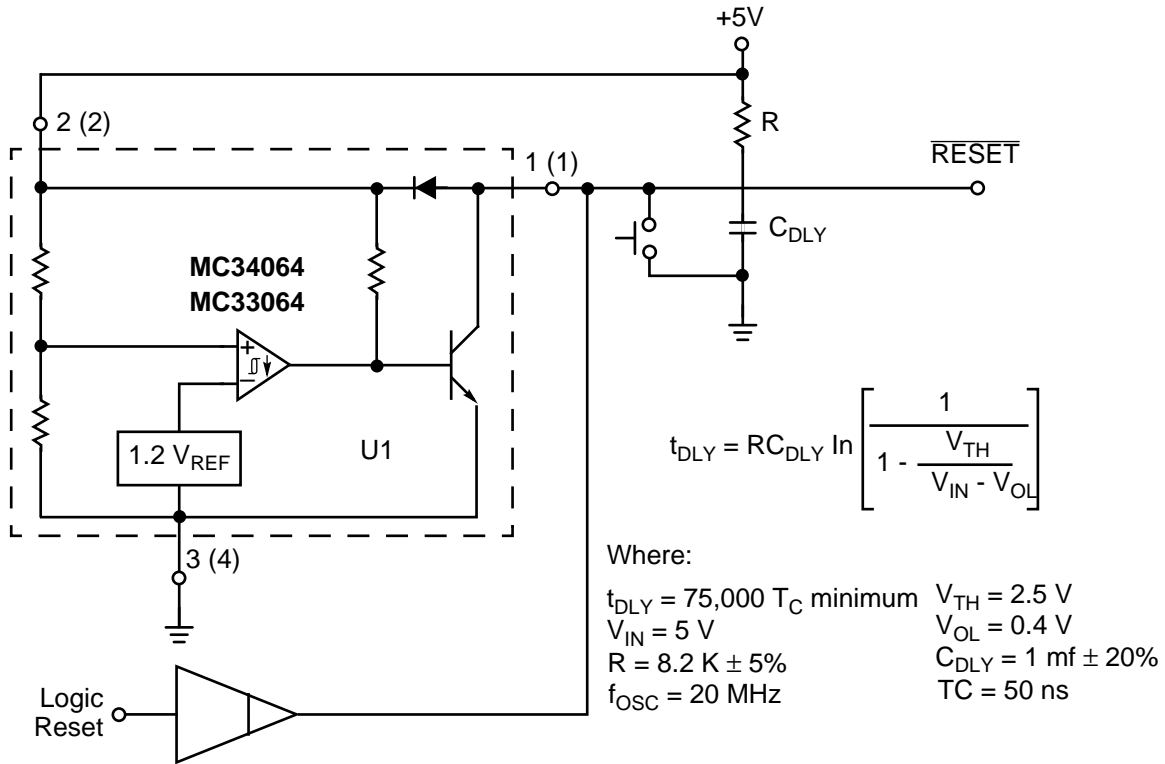

- Note:
1. All resistors are 15 K Ω unless noted otherwise.
 2. When in Reset, \overline{IRQA} and \overline{IRQB} must be deasserted by external peripherals.

AA0907

Figure 4-4 32K Words of External Program ROM—Mode 3

Figure 4-5 shows a circuit that waits until V_{CC} on the DSP56001A is at least 4.5 V before initiating a $75,000 \times T_C$ oscillator stabilization delay required for the on-chip oscillator (only $25 \times T_C$ is required for an external oscillator). This insures that the DSP is operational and stable before releasing the reset signal.

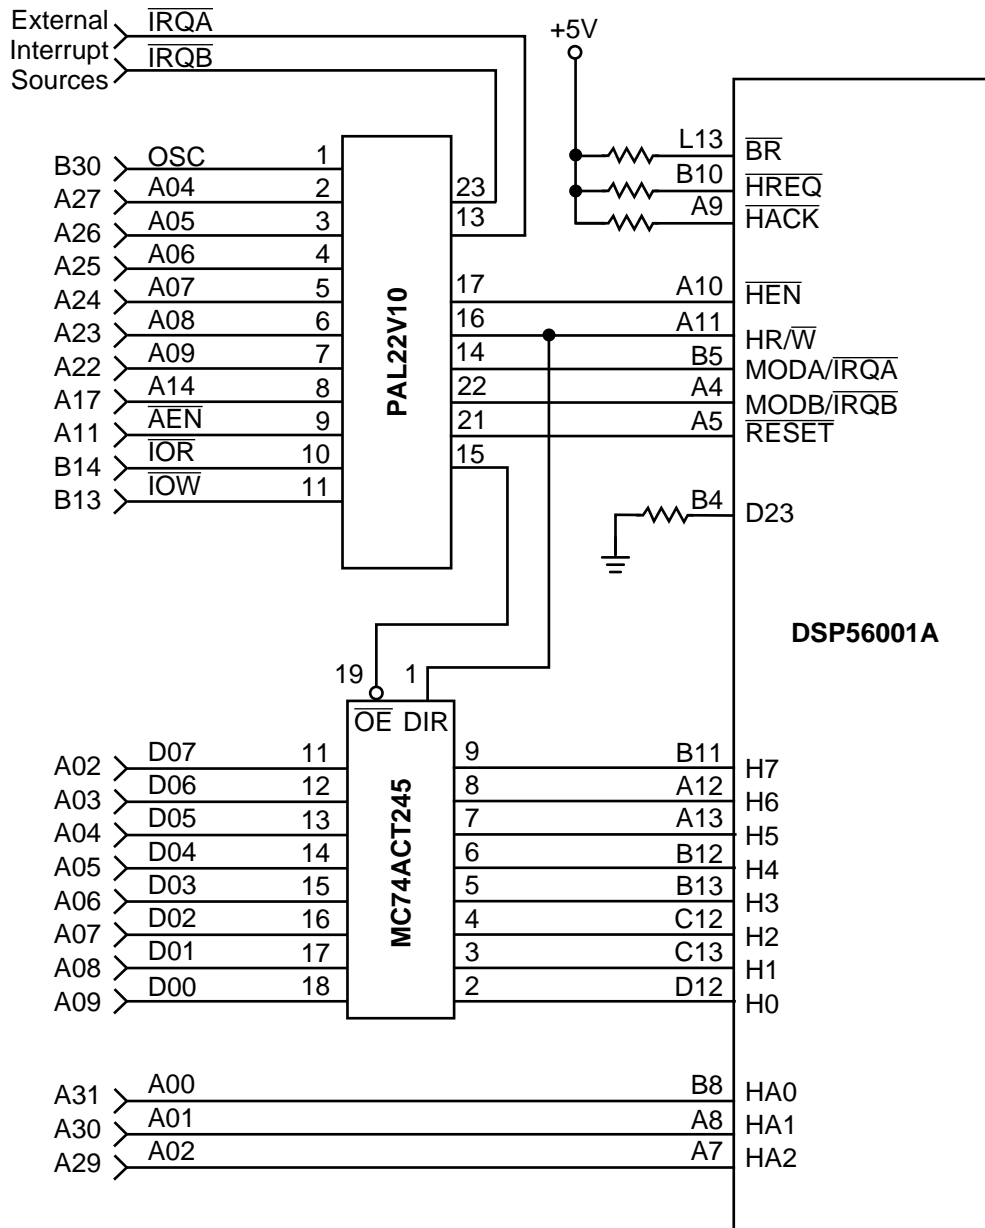

- Note:
1. \overline{IRQA} , and \overline{IRQB} must be driven to the logic levels appropriate for the application.
 2. MODA and MODB must be driven to the logic levels appropriate for the application.

AA0908

Figure 4-5 Reset Circuit Using MC34064/MC33064

Figure 4-6 shows the DSP56001A connected to the bus of an IBM-PC computer. This circuit is complete and does not require external ROM or RAM to load and execute code from the PC. The PAL equations and other details of this circuit are available in the application report entitled "DSP56001 Interface Techniques and Examples" (APR11/D).

- Note:
1. Connector is J1 of ISA Bus.
 2. All series resistors are 15 K Ω .

SECTION 5

ORDERING INFORMATION

Table 5-1 lists the pertinent information needed to place an order. Consult a Motorola Semiconductor sales office or authorized distributor to determine availability and to order parts.

Table 5-1 DSP56001A Ordering Information

Part	Package Type	Pin Count	Frequency (MHz)	Order Number
DSP56001A	Ceramic Pin-Grid Array (PGA)	88	27	DSP56001ARC27
			33	DSP56001ARC33
	Plastic Quad Flat Pack (PQFP)	132	27	DSP56001AFC27
			33	DSP56001AFC33
	Ceramic Quad Flat Pack (CQFP)	132	27	DSP56001AFE27
			33	DSP56001AFE33

APPENDIX A

ROM TABLE LISTINGS

The data ROM in the 56001A contains numeric tables.

Table A-1 contains the μ -law and A-law expansion table, stored in X-ROM from address X:\$100.

Table A-2 contains the sine wave table, stored in Y-ROM from address Y:\$100.

SINE WAVE TABLE

This sine wave table is normally used by FFT routines that use bit-reversed address pointers. This table can be used as it is for up to 512 point FFTs; however, for larger FFTs, the table must be copied to a different memory location to allow the Reverse-carry addressing mode to be used (see REVERSE-CARRY MODIFIER (Mn = \$0000) in the *DSP56001 User's Manual* for additional information).

Freescale Semiconductor, Inc.

Mfax is a trademark of Motorola, Inc.

Motorola reserves the right to make changes without further notice to any products herein. Motorola makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Motorola assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters which may be provided in Motorola data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. Motorola does not convey any license under its patent rights nor the rights of others. Motorola products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support life, or for any other application in which the failure of the Motorola product could create a situation where personal injury or death may occur. Should Buyer purchase or use Motorola products for any such unintended or unauthorized application, Buyer shall indemnify and hold Motorola and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Motorola was negligent regarding the design or manufacture of the part. Motorola and  are registered trademarks of Motorola, Inc. Motorola, Inc. is an Equal Opportunity/Affirmative Action Employer.
