

Descriptions

EC8317 is a positive, linear regulator featuring a low quiescent current (35uA typ.) with low dropout voltage, making it ideal for battery powered applications. The space- saving SOT-23-5 package are attractive for "Pocket" and "Hand Held" applications. EC8317 has Over Temperature Protection (OTP), and Over Current Protection (OCP) to prevent possible device failures due to improper or worst case applications. EC8317 is stable with an output capacitor of 2.2μF or greater.

Feature

- Very Low Dropout Voltage
- Guaranteed 600 mA Output
- Typical accuracy within 2%
- 35uA Quiescent Current
- Over Temperature Protection (OTP)
- Over Current Protection (OCP)
- Power Good Detector
- Power-Saving Shutdown Mode
- Space-Saving SOT23-5L
- Adjustable Output Voltages
- Low Temperature Coefficient
- RoHS Compliant and 100% Lead (Pb)-Free

Application

- Instrumentation
- Portable Electronics
- Wireless Devices
- Cordless Phones
- PC Peripherals
- Battery Powered Widgets
- Electronic Scales

Ordering Information

Detailed Description

EC8317 is a CMOS regulator containing a PMOS pass transistor, voltage reference, error amplifier, over-current protection, thermal shutdown, and Power Good detection circuitry.

The P-channel pass transistor receives data from the error amplifier, over-current shutdown, and thermal protection circuits. During normal operation, the error amplifier compares the output voltage to an internal precision voltage reference. Over Temperature Protection (OTP) and Over Current Protection (OCP) circuits become active when the junction temperature exceeds 150°C, or the current exceeds 600mA, respectively. During OTP, the output voltage remains low. Normal operation is restored when the junction temperature drops below 120°C.

External Capacitors

EC8317 is stable with an output capacitor to ground of 1.0μF or greater. Ceramic capacitors have the lowest ESR, and will offer the best AC performance. Conversely, Aluminum Electrolytic capacitors exhibit the highest ESR, resulting in the poorest AC response. Unfortunately, large value ceramic capacitors are comparatively expensive. One option is to parallel a 0.1μF ceramic capacitor with a 10μF Aluminum Electrolytic. The benefit is low ESR, high capacitance, and low over all cost.

A second capacitor is recommended between the input and ground to stabilize Vin. The input capacitor should be at least 0.1μF to have a beneficial effect. All capacitors should be placed in close proximity to the pins. A "Quiet" ground termination is desirable. This can be achieved with a "Star" connection..

Enable

The EN Pin is an enable control Pin, When The Enable pin pulled High, IC is enabled; when pulled low, the PMOS pass transistor shuts off, and all internal circuits are powered down. In this state, the quiescent current is less than 1 μ A. This pin behaves much like an electronic switch.
