

EDD1204ALTA, EDD1208ALTA, EDD1216ALTA**128 M-bit Synchronous DRAM with Double Data Rate
(4-bank, SSTL_2)****Description**

The EDD1204ALTA, EDD1208ALTA, EDD1216ALTA are high-speed 134,217,728 bits synchronous dynamic random-access memories, organized as 8,388,608x4x4, 4,194,304x8x4, 2,097,152x16x4 (word x bit x bank), respectively.

The synchronous DRAMs use Double Data Rate (DDR) where data bandwidth is twice of regular synchronous DRAM.

The synchronous DRAM is compatible with SSTL_2 (Stub Series terminated Logic for 2.5 V).

The synchronous DRAM is packaged in 66-pin Plastic TSOP (II).

Features

- Fully Synchronous Dynamic RAM with all input signals except DM, DQS and DQ referenced to a positive clock edge
- Double Data Rate interface
 - Differential CLK (/CLK) input
 - Data inputs and DM are synchronized with both edges of DQS
 - Data outputs and DQS are synchronized with a cross point of CLK and /CLK
- Quad internal banks operation
- Possible to assert random column address in every clock cycle
- Programmable Mode register set
 - /CAS latency (2, 2.5)
 - Burst length (2, 4, 8)
 - Wrap sequence (Sequential / Interleave)
- Automatic precharge and controlled precharge
- CBR (Auto) refresh and self refresh
- x4, x8, x16 organization
- Byte write control (x4, x8) by DM
- Byte write control (x16) by LDM and UDM
- 2.5 V \pm 0.2 V Power supply for V_{DD}
- 2.5 V \pm 0.2 V Power supply for V_{DDQ}
- Maximum clock frequency up to 133 MHz
- SSTL_2 compatible with all signals
- 4,096 refresh cycles/64 ms
- 66-pin Plastic TSOP (II) (10.16 mm (400))
- Burst termination by Precharge command and Burst stop command

The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.
Not all devices/types available in every country. Please check with local Elpida Memory, Inc. for availability and additional information.

1. Input/Output Pin Function

Pin name	Input/Output	Function
CLK, /CLK	Input	CLK and /CLK are the master clock inputs. The timing reference point for the differential clock is when CLK and /CLK cross. All control and address inputs except for DQ and DM are latched by a rising edge of CLK. By both of rising and falling edges of CLK, output DQ and DQS are validated.
CKE	Input	CKE controls power down mode. When the EDD12xxALTA is not in burst mode and CKE is negated, the device enters power down mode and deactivates internal clock signals, input buffers and output drivers. During power down mode, CKE must remain low.
/CS	Input	/CS low starts a command input cycle. When /CS is high, commands are ignored but the current operations will be continued.
/RAS, /CAS, /WE	Input	As well as regular SDRAMs, each combination of /RAS, /CAS, and /WE input in conjunction with /CS input at a rising edge of CLK determines SDRAM operation. Refer to the command table.
A0 – A11	Input	Row address is determined by A0 - A11 at the rising edge of CLK in active command cycle. It does not depend on the bit organization. Column address is determined by A0 - A9, A11 at the rising edge of CLK in read or write command cycle. It depends on the bit organization: A0 - A9, A11 for x4 device, A0 - A9 for x8 device, A0 - A8 for x16 device. A10 defines precharge mode. When A10 is high in precharge command cycle, all banks are precharged; when A10 is low, only the bank selected by BA0 and BA1 is precharged. When A10 is high in read or write command cycle, precharge starts automatically after the burst access.
BA0, BA1	Input	BA0, BA1 are bank select signals. In command cycle, BA0 and BA1 low select Bank A, BA0 high and BA1 low select bank B, BA0 low and BA1 high select bank C and then BA0 and BA1 high select bank D.
DQ0 – DQ15	Input/Output	DQ pins have the same function as I/O pins on conventional DRAMs.
DQS, LDQS, UDQS	Input/Output	Active on the both edges for data input and output.
DM, LDM, UDM	Input	DM's are latched by both of rising and falling edges of the DQS. In write mode, DM's control byte mask. Unlike regular SDRAMs, DM's do not control read operation.
V _{REF}	Input	V _{REF} is reference voltage for SSTL input buffers.
V _{DD} , V _{DDQ} , V _{SS} , V _{SSQ}	(Power Supply)	V _{DD} and V _{SS} are power supply pins for internal circuits. V _{DDQ} and V _{SSQ} are power supply pins for the output buffers.

2. Commands

Extended mode register set command

(/CS, /RAS, /CAS, /WE Low)

The EDD12xxALTA has an extended mode register that defines enabling or disabling DLL. In this command, A0 through A11, BA0 and BA1 are the data input pins.

After power on, the extended mode register set command must be executed for enabling or disabling DLL.

The extended mode register can be set only when all banks are in idle state.

During t_{MRD}, the EDD12xxALTA can not accept any other commands.

Fig.1 Extended mode register set command

Mode register set command

(/CS, /RAS, /CAS, /WE Low)

The EDD12xxALTA has a mode register that defines how the device operates. In this command, A0 through A11, BA0 and BA1 are the data input pins. After power on, the mode register set command must be executed to initialize the device.

The mode register can be set only when all banks are in idle state.

During t_{MRD}, the EDD12xxALTA can not accept any other commands.

Fig.2 Mode register set command

Bank activate command

(/CS, /RAS = Low, /CAS, /WE = High)

The EDD12xxALTA has four banks, each with 4,096 rows.

This command activates the bank and the row address selected by BA0 and BA1, and by A0 through A11 respectively.

This command corresponds to a conventional DRAM's /RAS falling.

Fig.3 Bank activate command

Precharge command

(/CS, /RAS, /WE= Low, /CAS = High)

This command begins precharge operation of the bank selected by BA0, BA1 and A10. When A10 is High, all banks are precharged, regardless of BA0 and BA1.

When A10 is Low, only the bank selected by BA0 and BA1 is precharged.

After this command, the EDD12xxALTA can't accept the activate command to the precharging bank during t_{RP} (precharge to activate command period).

This command can terminate the current burst operation.

This command corresponds to a conventional DRAM's /RAS rising.

Fig.4 Precharge command

Read command

(/CS, /CAS = Low, /RAS, /WE = High)

This command begins the burst read operation. The bank and the burst start column address are selected by BA0 and BA1 and by A0 through A11 respectively.

Read data is available after /CAS latency requirements which have been met.

And it is synchronized with DQS.

Fig.5 Read command

Write command

(/CS, /CAS, /WE = Low, /RAS = High)

This command begins burst write operation. The bank and the burst start column address are selected by BA0 and BA1 and by A0 through A11 respectively.

Write data must be input by DQ0 through DQ15. Byte mask data must be input by DM, LDM, and UDM. Both data must be synchronized with DQS that is inputted after this command.

Fig.6 Write command

CBR (auto) refresh command

(/CS, /RAS, /CAS = Low, /WE, CKE = High)

This command is a request to begin the CBR (auto) refresh operation. The refresh address is generated internally. Before executing CBR (auto) refresh, all banks must be precharged. After this cycle, all banks will be in the idle (precharged) state and ready for a bank activate command. During t_{RFC} (refresh command to refresh or activate command period), the EDD12xxALTA cannot accept any other command.

Fig.7 CBR (auto) refresh command

Self refresh entry command

(/CS, /RAS, /CAS, CKE = Low, /WE = High)

After the command execution, self refresh operation continues while CKE remains low. When CKE goes high, the EDD12xxALTA will exit the self refresh mode. During self refresh mode, refresh interval and refresh operation are performed internally, so there is no need for external control. Before executing self refresh, all banks must be precharged.

Fig.8 Self refresh entry command

Burst stop command

(/CS, /WE = Low, /RAS, /CAS = High)

This command can stop the current read burst operation.

Fig.9 Burst stop command

No operation

(/CS = Low, /RAS, /CAS, /WE = High)

This command is not an execution command.

This command doesn't begin or terminate any operation.

Fig.10 No operation

Remark H = High level, L = Low level, x = High or Low level (Don't care),

BA = Bank address, RA = Row address, CA = Column address, A10 = Precharge control address,

Op-Code = Operand code, Nop = No operation, AP = Auto precharge,

ILLEGAL = Device operation and/or data-integrity are not guaranteed

Notes 1. All entries assume that CKE is active (High level) during the preceding clock cycle and the current clock cycle.

2. ILLEGAL to bank in specified states; function may be legal in the bank indicated by BA0, BA1 depending on the state of that bank.

3. Nop to bank precharging or in idle state. May precharge bank indicated by BA0, BA1.

4. ILLEGAL if any bank is not idle.

5. ILLEGAL if t_{RAS} is not satisfied.

6. Must satisfy command interval and/or burst terminate condition.

4.5 Command Truth Table for CKE

Current State	CKE		/CS	/RAS	/CAS	/WE	Add	Command	Action	Notes

Remark H = High level, L = Low level, x = High or Low level (Don't care), V = Valid,
 Add = Address (A0 - A11, BA0, BA1),
 ILLEGAL = Device operation and/or data-integrity are not guaranteed

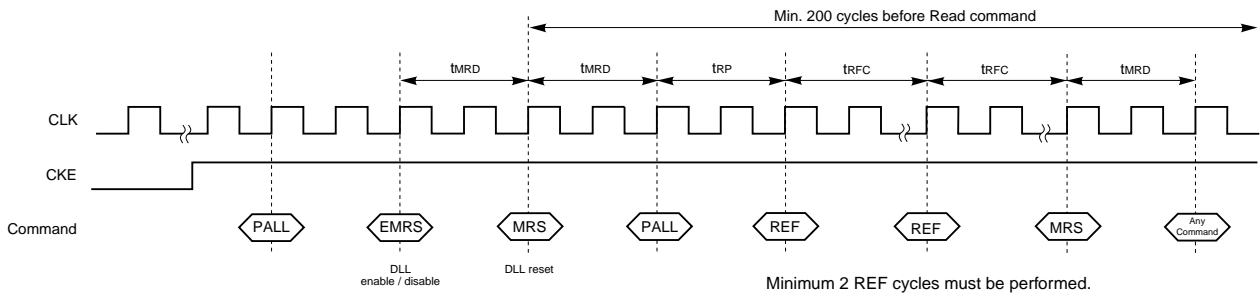

- Notes**
1. Self refresh can be entered only from all banks idle state.
 Power down can be entered only from all banks idle or row active state.
 2. CKE low to high transition will re-enable CLK and other inputs asynchronously.
 A Minimum setup time must be satisfied before any command other than exit.

5. Initialization

The EDD12xxALTA is initialized in the power-on sequence according to the following.

- (1) Power must first be applied to V_{DD}, then V_{DDQ}, and finally to V_{REF}. V_{TT} must be applied.
- (2) Maintaining an LVCMOS LOW level on CKE during power-up is required to guarantee that the DQ and DQS output will be in Hi-Z state.
- (3) To stabilize internal circuits, when power is applied a 100 μs or longer pause must precede any signal toggling.
- (4) After the pause, all banks must be precharged using precharge command. The precharge all banks command is convenient.
- (5) EMRS command must be performed to enable or disable DLL. Then MRS command must be applied to reset DLL. After this MRS command additional 200 cycles are required before read command.
- (6) All banks must be precharged using precharge command again. Then two or more CBR (auto) refresh command must be performed.
- (7) After the refresh the mode register can be programmed by MRS command.

Case 1: MRS after the REF

Remark Two refresh commands may be followed the first MRS command.

6. Programming the Mode Register

The mode register is programmed by the Mode register set command using address bits BA0, BA1, A11 through A0 as data inputs. The register retains data until it is reprogrammed or the device loses power.

The mode register has five fields;

Option : A11 through A9, A7
DLL reset : A8
/CAS latency : A6 through A4
Wrap type : A3
Burst length : A2 through A0

Following mode register programming, no command can be issued during t_{MRD} .

/CAS Latency

/CAS latency is the critical parameter. It tells how many clocks must elapse before the data is available. The value is determined by the frequency of the clock and the speed grade of the device.

Burst Length

Burst length is the number of words that will be output or input in read or write cycle. After read burst is completed, the output bus becomes Hi-Z.

The burst length is programmable as 2, 4 and 8.

Wrap Type (Burst Sequence)

The wrap type specifies the order in which the burst data is addressed. This order is programmable as either "Sequential" or "Interleave". The method chosen depends on the type of CPU in the system.

Some microprocessor cache system are optimized for sequential addressing and others for interleaved addressing.

7.1 Burst Length and Sequence shows the addressing sequence for each burst length using them. Both sequences support bursts of 2, 4 and 8.

The extended mode register has two fields;

Option : A11 through A1
DLL enable : A0

0	0	Enables Read/Write commands for Bank A
0	1	Enables Read/Write commands for Bank B
1	0	Enables Read/Write commands for Bank C
1	1	Enables Read/Write commands for Bank D

9. Precharge

9.1 Read to Precharge Command Interval

The precharge command can be issued anytime after $t_{RAS(MIN)}$ is satisfied. Soon after the precharge command is issued, precharge operation performed and the DDR SDRAM enters the idle state after t_{RP} is satisfied. The parameter t_{RP} is the time required to perform the precharge.

The earliest timing in a read cycle that a precharge command can be issued without losing any data in the burst is as follows.

$/CAS\ latency = 2$: (burst length/2) clocks after the read command is issued.

$/CAS\ latency = 2.5$: (burst length/2) clocks after the read command is issued.

(Must satisfy t_{RAS})

9.2 Write to Precharge Command Interval

In order to write all burst data to the memory cell correctly, the asynchronous parameter t_{WR} must be satisfied. The t_{WR} specification defines the earliest time that a precharge command can be issued.

10. Auto Precharge

During a read or write command cycle, A10 controls auto precharge. A10 high in the read or write command (read with auto precharge command or write with auto precharge command), auto precharge is selected and begins automatically.

The t_{RAS} must be satisfied with a read with auto precharge or a write with auto precharge operation. In addition, the next activate command to the bank being precharged cannot be executed until the precharge cycle ends.

In read cycle, once auto precharge starts, an activate command to the bank can be issued after t_{RP} is satisfied.

In write cycle, t_{DAL} must be satisfied to issue the next activate command to the bank being precharged.

10.1 Read with Auto Precharge

When a read with auto precharge command is issued, the auto precharge begins (Burst length / 2) clocks later from a read with auto precharge command.

Remark READA means Read with Auto Precharge command

10.2 Write with Auto Precharge

When a write with auto precharge command is issued, the auto precharge begins after t_{WR} is satisfied.

Remark WRITEA means Write with Auto Precharge command

11. Read/Write Command Interval

11.1 Read to Read Command Interval

During a read cycle, when new read command is issued, it will be effective after /CAS latency, even if the previous read operation is not completed. READ will be interrupted by another READ.

The interval between commands is minimum 1 cycle. Each read command can be issued in every clock without any restriction.

11.2 Write to Write Command Interval

During a write cycle, when new write command is issued, the previous burst will terminate and the new burst will begin with new write command. WRITE will be interrupted by another WRITE.

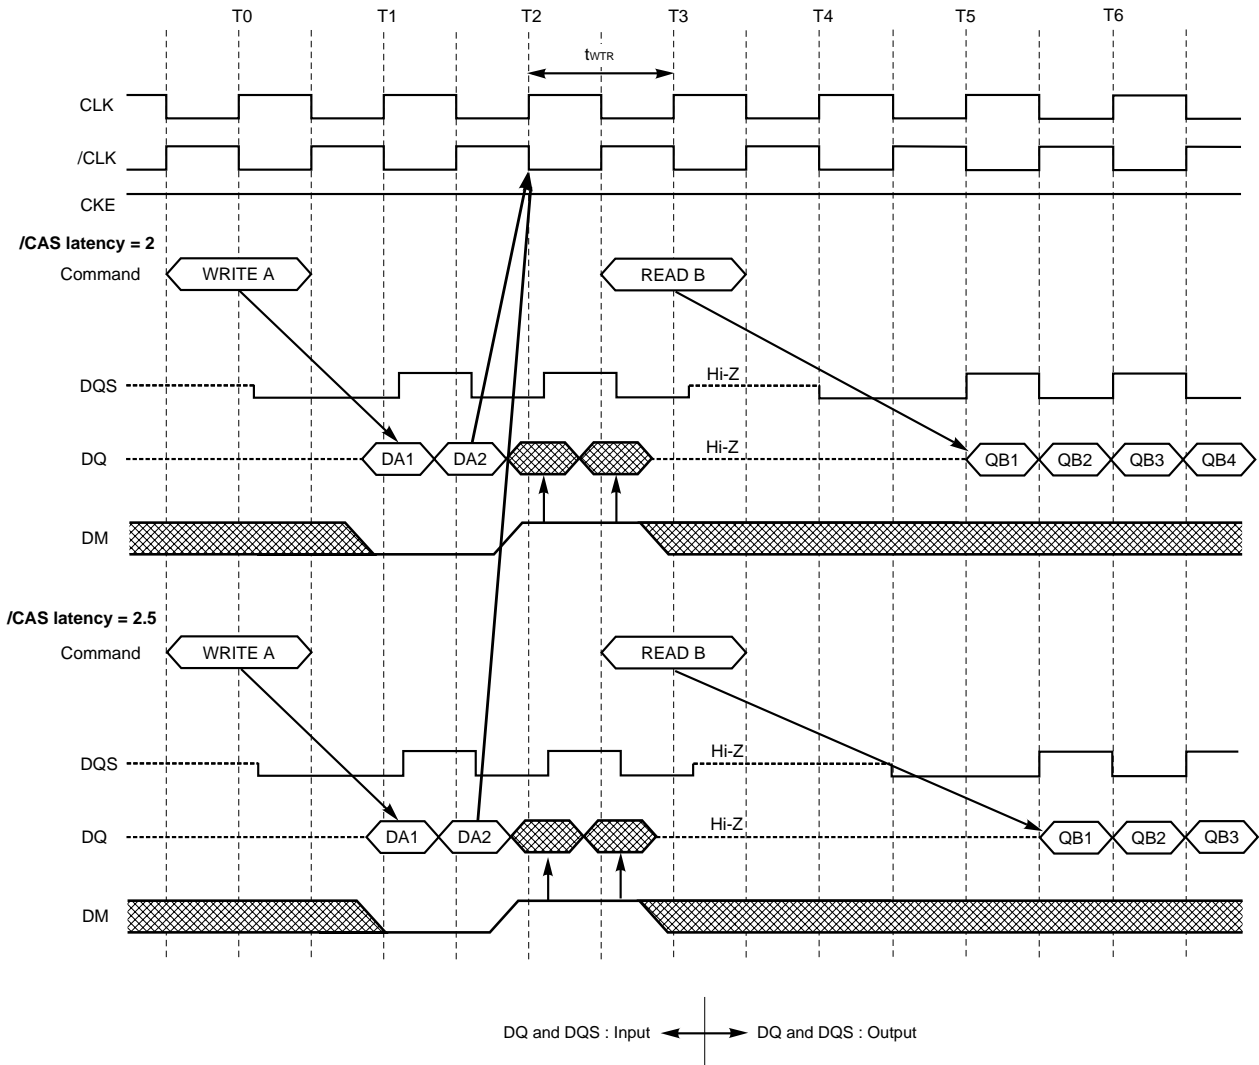

The interval between commands is minimum 1 cycle. Each write command can be issued in every clock without any restriction.

11.3 Write to Read Command Interval

The burst write operation can be interrupted by read command of any bank. The data bus must be high impedance at least 1 cycle prior to the first output data.

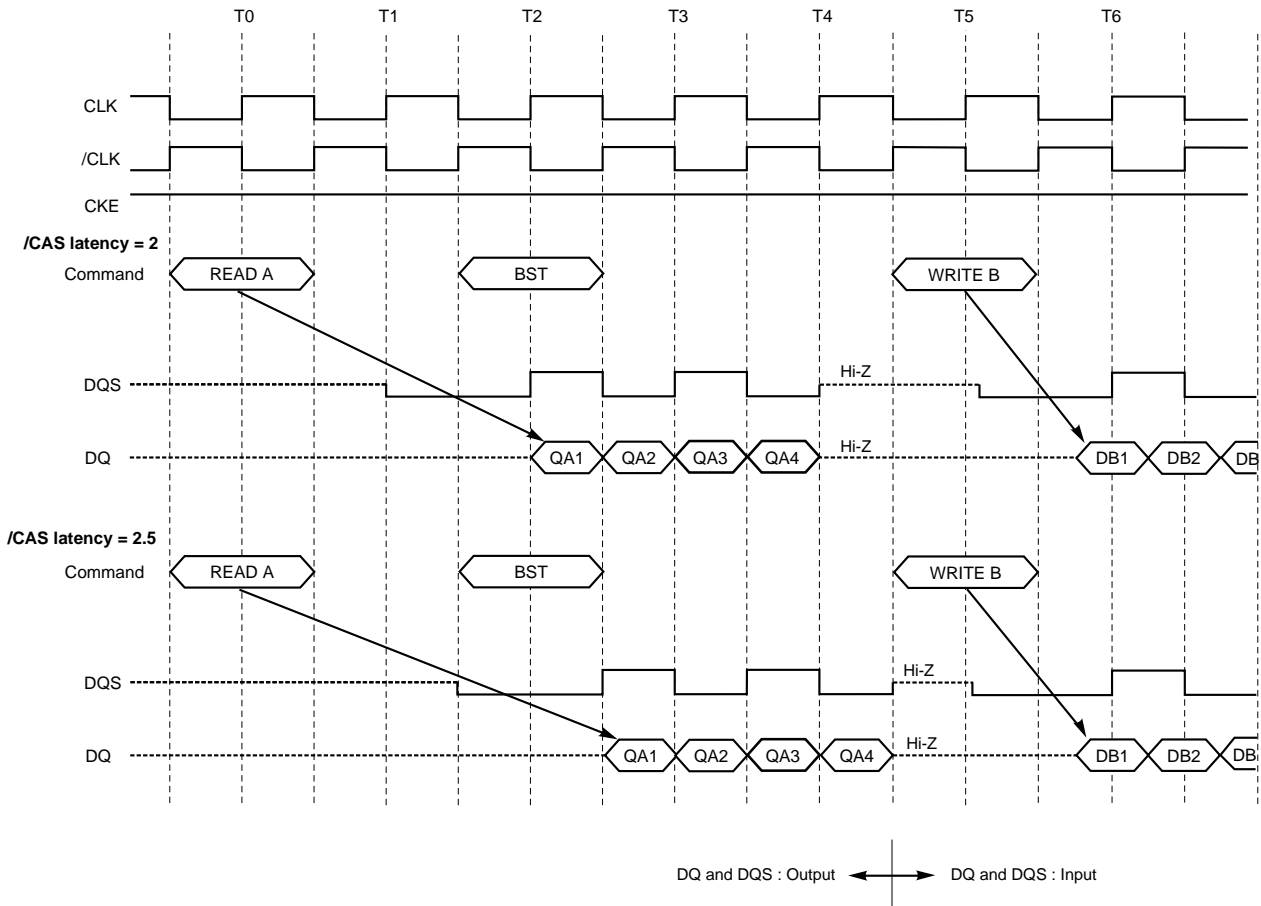

The minimum time interval between the rising clock edge after the last input data and the read command is t_{WTR} . When the read command is issued, the invalid data from the burst write cycle must be masked by DM.

11.4 Read to Write Command Interval

To interrupt the burst read operation using the write command, the burst stop command must be issued to avoid data conflict. The data bus must be high impedance when the write command is issued.

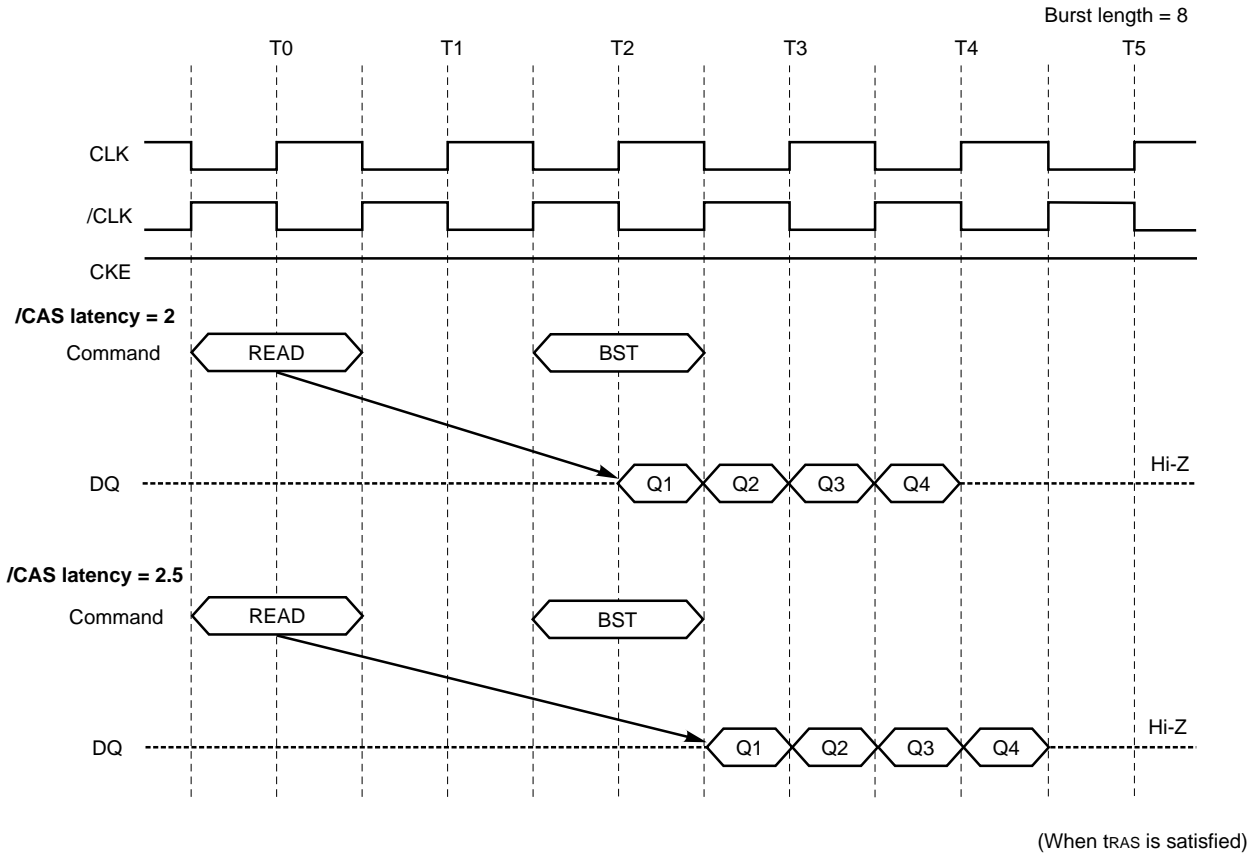

When the write command is issued, any residual data from the burst read cycle must be terminated by the burst stop command. When /CAS latency is 2, 2.5, the burst stop command must be issued at least 2 cycles prior to the write command.

12. Burst Termination

12.1 Burst Stop Command in Read Cycle

During a burst read cycle, when the burst stop command is issued at the rising edge of the clock (CLK), the burst read data are terminated and the data bus goes to high impedance after the /CAS latency from the burst stop command.

Remark BST means Burst Stop command

12.2 Terminating a Burst Read Cycle by Precharge Command

During a burst read cycle without auto precharge, the burst read operation is terminated by a precharge command of the same banks. When the precharge command is issued at the rising edge of the clock (CLK), the burst read operation is terminated and the data bus goes to high impedance after the /CAS latency from the precharge command. The precharge command can be issued after $t_{RAS(MIN.)}$ is satisfied.

12.3 Terminating a Burst Write Cycle by Precharge Command

During a burst write cycle without auto precharge, the burst write operation is terminated by a precharge command of the same banks. In order to write the last input data to the memory cell correctly, $t_{WR(MIN)}$ must be satisfied. When the precharge command is issued at the rising edge of the clock (CLK), the invalid data from the burst write cycle must be masked by DM.

13. Electrical Specifications

- All voltages are referenced to V_{SS} (GND).
- After power up, wait more than 100 μ s and then, execute **Power on sequence and CBR (auto) Refresh** before proper device operation is achieved.

13.1 Absolute Maximum Ratings

Parameter	Symbol	Condition	Rating	Unit
Voltage on power supply pin relative to V_{SS}	V_{DD}, V_{DDQ}		-0.5 to +3.6	V
Voltage on any pin relative to V_{SS}	V_T		-0.5 to +3.6	V
Short circuit output current	I_O		50	mA
Power dissipation	P_D		1	W
Storage temperature	T_{stg}		-55 to +125	$^{\circ}$ C

Caution Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

13.2 Recommended Operating Conditions

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Supply voltage	V_{DD}		2.3	2.5	2.7	V
Supply voltage for DQ, DQS	V_{DDQ}		2.3	2.5	2.7	V
Input reference voltage	V_{REF}		$0.49 \times V_{DDQ}$		$0.51 \times V_{DDQ}$	V
Termination voltage	V_{TT}		$V_{REF} - 0.04$	V_{REF}	$V_{REF} + 0.04$	V
High level dc input voltage	V_{IH} (DC)		$V_{REF} + 0.18$		$V_{DD} + 0.3$	V
Low level dc input voltage	V_{IL} (DC)		-0.3		$V_{REF} - 0.18$	V
Input differential voltage (CLK and /CLK)	V_{ID} (DC)		0.36		$V_{DDQ} + 0.6$	V
Input crossing point voltage (CLK and /CLK)	V_{IX}		$0.5 \times V_{DDQ} - 0.2$		$0.5 \times V_{DDQ} + 0.2$	V
Operating ambient temperature	T_A		0		70	$^{\circ}$ C

13.3 Pin Capacitance ($T_A = 25^{\circ}$ C, $f = 100$ MHz)

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input capacitance	C_{I1}	A0 - A11, BA0, BA1	2.5		3.5	pF
	C_{I2}	CLK, /CLK, CKE, /CS, /RAS, /CAS, /WE	2.5		3.5	pF
Data input/output capacitance	C_{IO1}	DQS, LDQS, UDQS	4		5	pF
	C_{IO2}	DQ0 - DQ15, DM, LDM, UDM	4		5	pF

Notes 1. I_{DD1} depends on output loading and cycle rates. Specified values are obtained with the output open.

2. I_{DD4R} and I_{DD4W} depend on output loading and cycle rates. Specified values are obtained with the output open.

13.5 DC Characteristics 2 (Recommended Operating Conditions unless otherwise noted)

Parameter	Symbol	Test condition	MIN.	MAX.	Unit	Notes
Input leakage current	I_{IL}	Any input $0\text{ V} \leq V_{IN} \leq V_{DD}$, all other pins not under test = 0 V	-2	2	μA	
Output leakage current	I_{OL}	D_{OUT} is disabled, $V_O = 0$ to $V_{DDQ} + 0.3\text{ V}$	-5	5	μA	
Output high current	I_{OH}	$V_{OUT} = 1.95\text{ V}$	-15.2		mA	
Output low current	I_{OL}	$V_{OUT} = 0.35\text{ V}$	15.2		mA	

13.6 AC Characteristics (Recommended Operating Conditions unless otherwise noted)

13.6.1 Test Conditions

Parameter	Symbol	MIN.	MAX.	Unit	Notes
Input Reference voltage (Input timing measurement reference level)	V_{REF}	$0.49 \times V_{DDQ}$	$0.51 \times V_{DDQ}$	V	
Termination voltage (Output timing measurement reference level)	V_{TT}	$V_{REF} - 0.04$	$V_{REF} + 0.04$	V	1
High level ac input voltage	$V_{IH}(ac)$	$V_{REF} + 0.31$		V	
Low level ac input voltage	$V_{IL}(ac)$		$V_{REF} - 0.31$	V	
Input differential voltage (CLK and /CLK)	$V_{ID}(ac)$	0.7	$V_{DDQ} + 0.6$	V	
Input signal slew rate	SLEW	1		V/ns	2

- Notes**
- Output waveform timing is measured where the output signal crosses through the V_{TT} level.
 - Slew rate is to be maintained in the $V_{IL}(ac)$ to $V_{IH}(ac)$ range of the input signal swing.

$$SLEW = (V_{IH}(ac) - V_{IL}(ac)) / \Delta t$$

PRE (Precharge) Termination of Burst (2/2) (Burst Length = 8, /CAS Latency = 2.5)

14. Package Drawing

66-PIN PLASTIC TSOP (II) (10.16 mm (400))

NOTES

1. Each lead centerline is located within 0.12 mm of its true position (T.P.) at maximum material condition.
2. Dimension "A" does not include mold flash, protrusions or gate burrs. Mold flash, protrusions or gate burrs shall not exceed 0.15mm per side.

ITEM	MILLIMETERS
A	22.22±0.05
B	0.865 MAX.
C	0.65 (T.P.)
D	0.24 ^{+0.08} _{-0.07}

	60	60	Modification	Random Row Write (2/2)
	65	65	Modification	Interleaved Column Write Cycle (1/2)
	66	66	Modification	Interleaved Column Write Cycle (2/2)
	69	69	Modification	Auto Precharge after Write Burst (1/2)
Ver. 3.0 October 2001	70	70	Modification	Auto Precharge after Write Burst (2/2)
	38	38	Addition	DC Characteristics specification
	39	39	Modification	$V_{IH(ac)}$ (MIN.): $V_{REF} + 0.35$ to $V_{REF} + 0.31$ $V_{IL(ac)}$ (MAX.): $V_{REF} + 0.35$ to $V_{REF} - 0.31$
	41	41	Modification	t_{HP} (MIN.): t_{CH} , t_{CL} to MIN. (t_{CH} , t_{CL})
	42	42	Modification	t_{WPRE} (MIN.) ($t_{CK} = 7.5ns$): 0.25 ns to 1.88 ns
	42	42	Modification	t_{DAL} (MIN.): TBD to 35 ns
	45	45	Modification	[t_{DAL}]: — to 5/5/5/4/4/4

NOTES FOR CMOS DEVICES**① PRECAUTION AGAINST ESD FOR MOS DEVICES**

Exposing the MOS devices to a strong electric field can cause destruction of the gate oxide and ultimately degrade the MOS devices operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it, when once it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. MOS devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. MOS devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor MOS devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS DEVICES

No connection for CMOS devices input pins can be a cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. The unused pins must be handled in accordance with the related specifications.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Power-on does not necessarily define initial status of MOS devices. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the MOS devices with reset function have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. MOS devices are not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for MOS devices having reset function.

The information in this document is subject to change without notice. Before using this document, confirm that this is the latest version.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of Elpida Memory, Inc.

Elpida Memory, Inc. does not assume any liability for infringement of any intellectual property rights (including but not limited to patents, copyrights, and circuit layout licenses) of Elpida Memory, Inc. or third parties by or arising from the use of the products or information listed in this document. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of Elpida Memory, Inc. or others.

Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of the customer's equipment shall be done under the full responsibility of the customer. Elpida Memory, Inc. assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

[Product applications]

Elpida Memory, Inc. makes every attempt to ensure that its products are of high quality and reliability. However, users are instructed to contact Elpida Memory's sales office before using the product in aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment, medical equipment for life support, or other such application in which especially high quality and reliability is demanded or where its failure or malfunction may directly threaten human life or cause risk of bodily injury.

[Product usage]

Design your application so that the product is used within the ranges and conditions guaranteed by Elpida Memory, Inc., including the maximum ratings, operating supply voltage range, heat radiation characteristics, installation conditions and other related characteristics. Elpida Memory, Inc. bears no responsibility for failure or damage when the product is used beyond the guaranteed ranges and conditions. Even within the guaranteed ranges and conditions, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Elpida Memory, Inc. products does not cause bodily injury, fire or other consequential damage due to the operation of the Elpida Memory, Inc. product.

[Usage environment]

This product is not designed to be resistant to electromagnetic waves or radiation. This product must be used in a non-condensing environment.

If you export the products or technology described in this document that are controlled by the Foreign Exchange and Foreign Trade Law of Japan, you must follow the necessary procedures in accordance with the relevant laws and regulations of Japan. Also, if you export products/technology controlled by U.S. export control regulations, or another country's export control laws or regulations, you must follow the necessary procedures in accordance with such laws or regulations.

If these products/technology are sold, leased, or transferred to a third party, or a third party is granted license to use these products, that third party must be made aware that they are responsible for compliance with the relevant laws and regulations.
