1. GENERAL DESCRIPTION

1.1 OVERVIEW

The EG121X1-L02-THA model is a 12.1" TFT-LCD module with a 2-LED Backlight Unit and a 20-pin 1ch-LVDS interface. This module supports 1024 x 768 XGA mode and displays 262,144 colors. The LED Driver module for the Backlight Unit is not built in.

1.2 FEATURES

- Wide viewing angle
- High contrast ratio
- Fast response time
- XGA (1024 x 768 pixels) resolution
- Wide operating temperature
- DE (Data Enable) mode
- LVDS (Low Voltage Differential Signaling) interface
- RoHS Compliance
- Led Replaceable
- Sunlight Readable

1.3 APPLICATION

- TFT LCD Monitor
- TFT LCD TV
- Industrial Application
- Amusement
- Vehicle

Vibration (Non-Operating)	1.5G, 10 ~ 300 Hz, 10min/cycle, 3 cycles each X, Y, Z	(3)

Note (1) There should be no condensation on the surface of panel during test.

Note (2) Temperature of panel display surface area should be 90 °C Max.

Note (3) At testing Vibration and Shock, the fixture in holding the module has to be hard and rigid enough so that the module would not be twisted or bent by the fixture.

Note (4) In the standard conditions, there is no function failure issue occurred. All the cosmetic specification is judged before the reliability test

Product Specification

Note : **The design of the LED Driver must have specification for the led in LCD Assembly.**

The performance of the LED in LCM, for example life time or brightness, is extremely influenced by the characteristics of the DC-DC LED Driver. So all the parameters of an LED Driver should be carefully designed so as not to produce too much leakage current from high-voltage output of the LED Driver.

When you design or order the LED Driver, please make sure unwanted lighting caused by the mismatch of the LED and the LED Driver(no lighting, flicker, etc) never occurs. When you confirm it, the LCD Assembly should be operated in the same condition as installed in you instrument.

1. The specified current and power consumption are under the $V_{CC}=3.3V$, $25^{\circ}C$, $f_V=60Hz$ condition whereas mosaic pattern is displayed and f_V is the frame frequency.
2. The variance of the voltage is $\pm 10\%$.
3. The voltage above V_S should be applied to the leds for more than 1 second for start-up. Otherwise, the leds may not be turned on. The used LED current is the LED typical current.
4. The output of the LED Driver must have symmetrical(negative and positive) voltage waveform and symmetrical current waveform.(Unsymmetrical ratio is less than 10%) Please do not use the LED Driver which has unsymmetrical voltage and unsymmetrical current and spike wave.
LED frequency may produce interface with horizontal synchronous frequency and as a result this may cause beat on the display. Therefore LED frequency shall be as away possible from the horizontal synchronous frequency and from its harmonics in order to prevent interference.
5. Let's define the brightness of the LED after being lighted for 5 minutes as 100%.
 T_s is the time required for the brightness of the center of the led to be not less than 95%.
6. The LED power consumption shown above does not include loss of external LED Driver.
The used LED current is the LED typical current.
7. The life is determined as the time at which brightness of the LED is 50% compared to that of initial value at the typical LED current on condition of continuous operating at $25 \pm 2^{\circ}C$.
8. Do not attach a conducting tape to LED connecting wire.
If the LED wire attach to a conducting tape, TFT-LCD Module has a low luminance and the LED Driver has abnormal action. Because leakage current is occurred between LED wire and conducting tape.

6.2 POWER ON/OFF SEQUENCE

To prevent a latch-up or DC operation of LCD module, the power on/off sequence should follow the conditions shown in the following diagram.

Power ON/OFF Sequence

Note (1) Please avoid floating state of interface signal at invalid period.

Note (2) When the interface signal is invalid, be sure to pull down the power supply of LCD Vcc to 0 V.

Note (3) The Backlight LED Driver power must be turned on after the power supply for the logic and the interface signal is valid. The Backlight LED Driver power must be turned off before the power supply for the logic and the interface signal is invalid.

Product Specification

Note (1) Definition of Viewing Angle (θ_x , θ_y):

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

$$\text{Contrast Ratio (CR)} = L_{63} / L_0$$

L63: Luminance of gray level 63

L 0: Luminance of gray level 0

$$\text{CR} = \text{CR} (5)$$

CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (6).

Note (3) Definition of Response Time (T_R , T_F) and measurement method:

Product Specification

Note (4) Definition of Luminance of White (L_C):

Measure the luminance of gray level 63 at center point

$L_C = L(5)$

$L(x)$ is corresponding to the luminance of the point X at Figure in Note (6).

Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature for 20 minutes to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 20 minutes in a windless room.

Product Specification

Note (6) Definition of White Variation (δW):
Measure the luminance of gray level 63 at 5 points

$\delta W =$ Maximum [L (1), L (2), L (3), L (4), L (5)]
 Minimum [L (1), L (2), L (3), L (4), L (5)]

10. PRECAUTIONS

10.1 ASSEMBLY AND HANDLING PRECAUTIONS

- (1) Do not apply rough force such as bending or twisting to the module during assembly.
- (2) To assemble or install module into user's system can be only in clean working areas. The dust and oil may cause electrical short or worsen the polarizer.
- (3) It's not permitted to have pressure or impulse on the module because the LCD panel and Backlight will be damaged.
- (4) Always follow the correct power sequence when LCD module is connecting and operating. This can prevent damage to the CMOS LSI chips during latch-up.
- (5) Do not pull the I/F connector in or out while the module is operating.
- (6) Do not disassemble the module.
- (7) Use a soft dry cloth without chemicals for cleaning, because the surface of polarizer is very soft and easily scratched.
- (8) It is dangerous that moisture come into or contacted the LCD module, because moisture may damage LCD module when it is operating.
- (9) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (10) When ambient temperature is lower than 10 C may reduce the display quality. For example, the response time will become slowly, and the starting voltage of LED will be higher than room temperature.

10.2 SAFETY PRECAUTIONS

- (1) The startup voltage of Backlight is approximately 1000 Volts. It may cause electrical shock while assembling with LED Driver. Do not disassemble the module or insert anything into the Backlight unit.
- (2) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contact with hands, skin or clothes, it has to be washed away thoroughly with soap.
- (3) After the module's end of life, it is not harmful in case of normal operation and storage.
