General Description

The EL2424 monolithic quad operational amplifier is an example of Elantec's commitment to high speed low power consumption products. This amplifier is unity-gain stable, exhibits Slew Rates of 200V per microsecond, and a Gain Bandwidth of 60 MHz while drawing supply currents of 4 mA per amplifier. The output provides short circuit protection but is capable of delivering currents in excess of 50 mA. The device is manufactured using Elantec's advanced Complementary Bipolar process.

The EL2424 is available in 14-lead Plastic DIP, 14-lead CerDIP, 20-pad LCC, and 20-pad SOL.

Elantec's products and facilities comply with MIL-STD-883, Revision C, MIL-I-45082A, and other applicable quality assurance specifications. For information on Elantec's Military processing, see QRA-2, "Elantec's Military Processing, Monolithic Integrated Circuits". For information on Elantec's Commercial processing, see QRA-1, "Summary of Elantec's Reliability and Quality Assurance Policy".

Important Note:

All parameters having Min/Max specifications are guaranteed. The Test Level column indicates the specific device testing actually performed during production and Quality inspection. Elantec performs most electrical tests using modern high-speed automatic test equipment, specifically the LTX77 Series system. Unless otherwise noted, all tests are pulsed tests, therefore $T_J = T_C = T_A$.

Test Level	Test Procedure
I	100% production tested and QA sample tested per QA test plan QCX0002.
II	100% production tested at $T_A = 25^\circ\text{C}$ and QA sample tested at $T_A = 25^\circ\text{C}$, T_{MAX} and T_{MIN} per QA test plan QCX0002.
III	QA sample tested per QA test plan QCX0002.
IV	Parameter is guaranteed (but not tested) by Design and Characterization Data.
V	Parameter is typical value at $T_A = 25^\circ\text{C}$ for information purposes only.

Note 3: $R_L = 2\text{ k}\Omega$.

Note 4: Two tests are performed. $V_{CM} = 0V$ to $+10V$ and $V_{CM} = 0V$ to $-10V$.

Note 5: Two tests are performed. $V_+ = 15V$, and V_- is changed from $-5V$ to $-15V$. $V_- = -15V$, and V_+ is changed from $+5V$ to $+15V$.

Note 6: $V_O = 100\text{ mV}$.

Note 7: Full Power Bandwidth guaranteed based on slew rate measurement using: $FPBW = \text{Slew Rate}/2\pi V_{peak}$.

Note 8: Refer to Test Circuit section of data sheet.

Note 9: Settling time measurements are made with techniques in the following reference: "Take The Guesswork Out of Settling-Time Measurements," EDN September 19, 1985.
