

EMC1186

Dual Channel 1°C Temperature Sensor with Hardware Thermal Shutdown and 1.8V SMBus Communications

PRODUCT FEATURES

Datasheet

General Description

The EMC1186 is a high accuracy, low cost, 1.8V System Management Bus (SMBus) compatible temperature sensor. Advanced features such as Resistance Error Correction (REC), Beta Compensation (to support CPU diodes requiring the BJT/transistor model including 65nm and lower geometry processors) and automatic diode type detection combine to provide a robust solution for complex environmental monitoring applications. The ability to communicate at 1.8V SMBus levels provides compatible I/O for the advanced processors found in today's tablet and smartphone applications.

The EMC1186 monitors two temperature channels (one external and one internal), providing $\pm 1^\circ\text{C}$ accuracy for both external and internal diode temperatures.

Additionally, the EMC1186 provides a hardware programmable system shutdown feature that is programmed at part power-up via two pull-up resistor values and that cannot be masked or corrupted through the SMBus.

REC automatically eliminates the temperature error caused by series resistance allowing greater flexibility in routing thermal diodes. Frequency hopping* and analog filters ensure remote diode traces can be as far as eight (8) inches without degrading the signal. Beta Compensation eliminates temperature errors caused by low, variable beta transistors common in today's fine geometry processors. The automatic beta detection feature monitors the external diode/transistor and determines the optimum sensor settings for accurate temperature measurements regardless of processor technology. This frees the user from providing unique sensor configurations for each temperature monitoring application. These advanced features plus $\pm 1^\circ\text{C}$ measurement accuracy provide a low-cost, highly flexible and accurate solution for critical temperature monitoring applications.

Applications

- Notebook Computers
- Desktop Computers
- Industrial
- Embedded applications

Features

- **Hardware Thermal Shutdown**
 - triggers dedicated SYS_SHDN pin
 - hardware configured range 77°C to 112°C in 1°C steps
 - cannot be disabled or modified by software
- Support for diodes requiring the BJT/transistor model
 - Supports 65nm and lower geometry CPU thermal diodes
- Pin and register compatible with EMC1422
- Automatically determines external diode type and optimal settings
- Resistance Error Correction
- Frequency hops the remote sample frequency to reject DC converter and other coherent noise sources*
- Consecutive Alert queue to further reduce false Alerts
- Up to 1 External Temperature Monitors
 - 25°C typ, $\pm 1^\circ\text{C}$ max accuracy ($20^\circ\text{C} < T_{\text{DIODE}} < 110^\circ\text{C}$)
 - 0.125°C resolution
 - Supports up to 2.2nF diode filter capacitor
- Internal Temperature Monitor
 - $\pm 1^\circ\text{C}$ accuracy
 - 0.125°C resolution
- 3.3V Supply Voltage
- 1.8V SMBus operation
- Programmable temperature limits for ALERT (85°C default high limit and 0°C default low limit)
- Available in small 8-pin 2mm x 3mm TDFN RoHS compliant package

* Technology covered under the US patent 7,193,543.

Ordering Information:

| ORDERING NUMBER | PACKAGE | FEATURES | SMBUS ADDRESS |
|------------------------|--|--|----------------------|
| EMC1186-1-AC3-TR | 8-pin TDFN 2mm x 3mm (RoHS compliant) | Two temperature sensors, hardware set system shutdown, $\overline{\text{ALERT}}$ and $\overline{\text{SYS_SHDN}}$ pins, fixed SMBus address | 1001_100(r/w) |
| EMC1186-2-AC3-TR | 8-pin TDFN 2mm x 3mm (RoHS compliant) | Two temperature sensors, hardware set system shutdown, $\overline{\text{ALERT}}$ and $\overline{\text{THERM}}$ pins, fixed SMBus address | 1001_101(r/w) |

This product meets the halogen maximum concentration values per IEC61249-2-21

Chapter 1 Block Diagram

Figure 1.1 EMC1186 Block Diagram

Chapter 2 Pin Description

Figure 2.1 EMC1186 Pin Diagram, TDFN-8 2mm x 3mm

The pin types are described [Table 2.2](#).

Table 2.1 EMC1186 Pin Description

| PIN NUMBER | NAME | FUNCTION | TYPE |
|------------|-------------------------------|--|-----------|
| 1 | VDD | Power supply | Power |
| 2 | DP | External diode positive (anode) connection | AIO |
| 3 | DN | External diode negative (cathode) connection | AIO |
| 4 | $\overline{\text{SYS_SHDN}}$ | Active low system shutdown output signal - requires pull-up resistor which selects the Hardware Thermal Shutdown Limit | OD (5V) |
| 5 | GND | Ground | Power |
| 6 | $\overline{\text{ALERT}}$ | Active low digital $\overline{\text{ALERT}}$ output signal - requires pull-up resistor | OD (5V) |
| 7 | SMDATA | SMBus Data input/output - requires pull-up resistor | DIOD (5V) |
| 8 | SMCLK | SMBus Clock input - requires pull-up resistor | DI (5V) |
| Bottom Pad | Exposed Pad | Not internally connected, but recommend grounding. | - |

Table 2.2 Pin Types

| PIN TYPE | DESCRIPTION |
|-----------------|---|
| Power | This pin is used to supply power or ground to the device. |
| AIO | Analog Input / Output -This pin is used as an I/O for analog signals. |
| DI | Digital Input - This pin is used as a digital input. This pin is 5V tolerant. |
| DIOD | Digital Input / Open Drain Output - This pin is used as a digital I/O. When it is used as an output, it is open drain and requires a pull-up resistor. This pin is 5V tolerant. |
| OD | Open Drain Digital Output - This pin is used as a digital output. It is open drain and requires a pull-up resistor. This pin is 5V tolerant. |

Chapter 3 Electrical Specifications

3.1 Absolute Maximum Ratings

Table 3.1 Absolute Maximum Ratings

| DESCRIPTION | RATING | UNIT |
|---|--------------------------------|------|
| Supply Voltage (V_{DD}) | -0.3 to 4.0 | V |
| Voltage on 5V tolerant pins (V_{5VT_pin}) | -0.3 to 5.5 | V |
| Voltage on 5V tolerant pins ($(V_{5VT_pin} - V_{DD})$) (see Note 3.1) | 0 to 3.6 | V |
| Voltage on any other pin to Ground | -0.3 to $V_{DD} + 0.3$ | V |
| Operating Temperature Range | -40 to +125 | °C |
| Storage Temperature Range | -55 to +150 | °C |
| Lead Temperature Range | Refer to JEDEC Spec. J-STD-020 | |
| Package Thermal Characteristics for DFN-10 | | |
| Thermal Resistance (θ_{j-a}) | 77.1 | °C/W |
| ESD Rating, All pins HBM | 2000 | V |

Note: Stresses at or above those listed could cause permanent damage to the device. This is a stress rating only and functional operation of the device at any other condition above those indicated in the operation sections of this specification is not implied.

Note 3.1 For the 5V tolerant pins that have a pull-up resistor (SMCLK, SMDATA, $\overline{\text{SYS_SHDN}}$, and ALERT), the pull-up voltage must not exceed 3.6V when the device is unpowered.

3.2 Electrical Specifications

Table 3.2 Electrical Specifications

| $V_{DD} = 3.0V$ to $3.6V$, $T_A = -40^\circ C$ to $125^\circ C$, all typical values at $T_A = 27^\circ C$ unless otherwise noted. | | | | | | |
|---|----------|-----|-----|-----|---------|---|
| CHARACTERISTIC | SYMBOL | MIN | TYP | MAX | UNITS | CONDITIONS |
| DC Power | | | | | | |
| Supply Voltage | V_{DD} | 3.0 | 3.3 | 3.6 | V | |
| Supply Current | I_{DD} | | 200 | 410 | μA | 0.0625 conversion / sec, dynamic averaging disabled |
| | | | 215 | 425 | μA | 1 conversion / sec, dynamic averaging disabled |
| | | | 325 | 465 | μA | 4 conversions / sec, dynamic averaging disabled |

Table 3.2 Electrical Specifications (continued)

| V _{DD} = 3.0V to 3.6V, T _A = -40°C to 125°C, all typical values at T _A = 27°C unless otherwise noted. | | | | | | |
|--|---------------------|-----|-------|------|-------|---|
| CHARACTERISTIC | SYMBOL | MIN | TYP | MAX | UNITS | CONDITIONS |
| | | | 890 | 1050 | μA | 4 conversions / sec, dynamic averaging enabled |
| | | | 1120 | | μA | ≥ 16 conversions / sec, dynamic averaging enabled |
| Internal Temperature Monitor | | | | | | |
| Temperature Accuracy | | | ±0.25 | ±1 | °C | -5°C < T _A < 100°C |
| | | | | ±2 | °C | -40°C < T _A < 125°C |
| Temperature Resolution | | | 0.125 | | °C | |
| External Temperature Monitor | | | | | | |
| Temperature Accuracy | | | ±0.25 | ±1 | °C | +20°C < T _{DIODE} < +110°C 0°C < T _A < 100°C |
| | | | | ±0.5 | ±2 | °C |
| Temperature Resolution | | | 0.125 | | °C | |
| Conversion Time all Channels | t _{CONV} | | 150 | | ms | default settings |
| Capacitive Filter | C _{FILTER} | | 2.2 | 2.7 | nF | Connected across external diode |
| ALERT and SYS_SHDN pins | | | | | | |
| Output Low Voltage | V _{OL} | 0.4 | | | V | I _{SINK} = 8mA |
| Leakage Current | I _{LEAK} | | | ±5 | μA | ALERT and SYS_SHDN pins Device powered or unpowered T _A < 85°C pull-up voltage ≤ 3.6V |

3.3 SMBus Electrical Characteristics

Table 3.3 SMBus Electrical Specifications

| V _{DD} = 3.0 to 3.6V, T _A = -40°C to 125°C, all typical values are at T _A = 27°C unless otherwise noted. | | | | | | |
|---|-------------------|------|-----|-----------------|-------|--|
| CHARACTERISTIC | SYMBOL | MIN | TYP | MAX | UNITS | CONDITIONS |
| SMBus Interface | | | | | | |
| Input High Voltage | V _{IH} | 1.4 | | V _{DD} | V | 5V Tolerant. Voltage threshold based on 1.8V operation |
| Input Low Voltage | V _{IL} | -0.3 | | 0.8 | V | 5V Tolerant. Voltage threshold based on 1.8V operation |
| Leakage Current | I _{LEAK} | | | ±5 | μA | Powered or unpowered T _A < 85°C |

Table 3.3 SMBus Electrical Specifications (continued)

| $V_{DD} = 3.0$ to $3.6V$, $T_A = -40^{\circ}C$ to $125^{\circ}C$, all typical values are at $T_A = 27^{\circ}C$ unless otherwise noted. | | | | | | |
|---|---------------|-----|-----|-----|---------|---------------------------------|
| CHARACTERISTIC | SYMBOL | MIN | TYP | MAX | UNITS | CONDITIONS |
| Hysteresis | | 50 | | | mV | |
| Input Capacitance | C_{IN} | | 5 | | pF | |
| Output Low Sink Current | I_{OL} | 8.2 | | 15 | mA | SMDATA = 0.4V |
| SMBus Timing | | | | | | |
| Clock Frequency | f_{SMB} | 10 | | 400 | kHz | |
| Spike Suppression | t_{SP} | | | 50 | ns | |
| Bus Free Time Stop to Start | t_{BUF} | 1.3 | | | μs | |
| Hold Time: Start | $t_{HD:STA}$ | 0.6 | | | μs | |
| Setup Time: Start | $t_{SU:STA}$ | 0.6 | | | μs | |
| Setup Time: Stop | $t_{SU:STO}$ | 0.6 | | | μs | |
| Data Hold Time | $t_{HD:DAT}$ | 0 | | | μs | When transmitting to the master |
| Data Hold Time | $t_{HD:DAT}$ | 0.3 | | | μs | When receiving from the master |
| Data Setup Time | $t_{SU:DAT}$ | 100 | | | ns | |
| Clock Low Period | t_{LOW} | 1.3 | | | μs | |
| Clock High Period | t_{HIGH} | 0.6 | | | μs | |
| Clock/Data Fall time | t_{FALL} | | | 300 | ns | Min = $20+0.1C_{LOAD}$ ns |
| Clock/Data Rise time | t_{RISE} | | | 300 | ns | Min = $20+0.1C_{LOAD}$ ns |
| Capacitive Load | C_{LOAD} | | | 400 | pF | per bus line |
| Timeout | $t_{TIMEOUT}$ | 25 | | 35 | ms | Disabled by default |

Chapter 4 System Management Bus Interface Protocol

4.1 Communications Protocol

The EMC1186 communicates with a host controller, such as an SMSC SIO, through the SMBus. The SMBus is a two-wire serial communication protocol between a computer host and its peripheral devices. A detailed timing diagram is shown in [Figure 4.1](#).

For the first 15ms after power-up the device may not respond to SMBus communications.

Figure 4.1 SMBus Timing Diagram

4.1.1 SMBus Start Bit

The SMBus Start bit is defined as a transition of the SMBus Data line from a logic '1' state to a logic '0' state while the SMBus Clock line is in a logic '1' state.

4.1.2 SMBus Address and RD / $\overline{\text{WR}}$ Bit

The SMBus Address Byte consists of the 7-bit client address followed by the RD / $\overline{\text{WR}}$ indicator bit. If this RD / $\overline{\text{WR}}$ bit is a logic '0', the SMBus Host is writing data to the client device. If this RD / $\overline{\text{WR}}$ bit is a logic '1', the SMBus Host is reading data from the client device.

The EMC1186-1 SMBus address is hard coded to 1001_100(r $\overline{\text{w}}$).

The EMC1186-2 SMBus address is hard coded to 1001_101(r $\overline{\text{w}}$).

4.1.3 SMBus Data Bytes

All SMBus Data bytes are sent most significant bit first and composed of 8-bits of information.

4.1.4 SMBus ACK and NACK Bits

The SMBus client will acknowledge all data bytes that it receives. This is done by the client device pulling the SMBus data line low after the 8th bit of each byte that is transmitted. This applies to the Write Byte protocol.

The Host will NACK (not acknowledge) the last data byte to be received from the client by holding the SMBus data line high after the 8th data bit has been sent.

4.1.5 SMBus Stop Bit

The SMBus Stop bit is defined as a transition of the SMBus Data line from a logic '0' state to a logic '1' state while the SMBus clock line is in a logic '1' state. When the device detects an SMBus Stop bit and it has been communicating with the SMBus protocol, it will reset its client interface and prepare to receive further communications.

4.1.6 SMBus Timeout

The EMC1186 supports SMBus Timeout. If the clock line is held low for longer than t_{TIMEOUT} , the device will reset its SMBus protocol. This function can be enabled by setting the TIMEOUT bit (see [Section 6.11, "Consecutive ALERT Register 22h"](#)).

4.1.7 SMBus and I²C Compatibility

The EMC1186 is compatible with SMBus and I²C. The major differences between SMBus and I²C devices are highlighted here. For more information, refer to the SMBus 2.0 and I²C specifications. For information on using the EMC1186 in an I²C system, refer to SMSC AN 14.0 SMSC Dedicated Slave Devices in I²C Systems.

1. EMC1186 supports I²C fast mode at 400kHz. This covers the SMBus max time of 100kHz.
2. Minimum frequency for SMBus communications is 10kHz.
3. The SMBus client protocol will reset if the clock is held at a logic '0' for longer than 30ms. This timeout functionality is disabled by default in the EMC1186 and can be enabled by writing to the TIMEOUT bit. I²C does not have a timeout.
4. I²C devices do not support the Alert Response Address functionality (which is optional for SMBus).

Attempting to communicate with the EMC1186 SMBus interface with an invalid slave address or invalid protocol will result in no response from the device and will not affect its register contents. Stretching of the SMCLK signal is supported, provided other devices on the SMBus control the timing.

4.2 SMBus Protocols

The device supports Send Byte, Read Byte, Write Byte, Receive Byte, and the Alert Response Address as valid protocols as shown below.

All of the below protocols use the convention in [Table 4.1](#).

Table 4.1 Protocol Format

| DATA SENT TO DEVICE | DATA SENT TO THE HOST |
|---------------------|-----------------------|
| # of bits sent | # of bits sent |

4.2.1 Write Byte

The Write Byte is used to write one byte of data to the registers, as shown in [Table 4.2](#).

Table 4.2 Write Byte Protocol

| START | SLAVE ADDRESS | WR | ACK | REGISTER ADDRESS | ACK | REGISTER DATA | ACK | STOP |
|--------|---------------|----|-----|------------------|-----|---------------|-----|--------|
| 1 -> 0 | YYYY_YYY | 0 | 0 | XXh | 0 | XXh | 0 | 0 -> 1 |

4.2.2 Read Byte

The Read Byte protocol is used to read one byte of data from the registers as shown in [Table 4.3](#).

Table 4.3 Read Byte Protocol

| START | SLAVE ADDRESS | WR | ACK | REGISTER ADDRESS | ACK | START | SLAVE ADDRESS | RD | ACK | REGISTER DATA | NACK | STOP |
|--------|---------------|----|-----|------------------|-----|--------|---------------|----|-----|---------------|------|--------|
| 1 -> 0 | YYYY_YYY | 0 | 0 | XXh | 0 | 1 -> 0 | YYYY_YYY | 1 | 0 | XX | 1 | 0 -> 1 |

4.2.3 Send Byte

The Send Byte protocol is used to set the internal address register pointer to the correct address location. No data is transferred during the Send Byte protocol as shown in [Table 4.4](#).

Table 4.4 Send Byte Protocol

| START | SLAVE ADDRESS | WR | ACK | REGISTER ADDRESS | ACK | STOP |
|--------|---------------|----|-----|------------------|-----|--------|
| 1 -> 0 | YYYY_YYY | 0 | 0 | XXh | 0 | 0 -> 1 |

4.2.4 Receive Byte

The Receive Byte protocol is used to read data from a register when the internal register address pointer is known to be at the right location (e.g. set via Send Byte). This is used for consecutive reads of the same register as shown in [Table 4.5](#).

Table 4.5 Receive Byte Protocol

| START | SLAVE ADDRESS | RD | ACK | REGISTER DATA | NACK | STOP |
|--------|---------------|----|-----|---------------|------|--------|
| 1 -> 0 | YYYY_YYY | 1 | 0 | XXh | 1 | 0 -> 1 |

4.3 Alert Response Address

The $\overline{\text{ALERT}}$ output can be used as a processor interrupt or as an SMBus Alert.

When it detects that the $\overline{\text{ALERT}}$ pin is asserted, the host will send the Alert Response Address (ARA) to the general address of 0001_100xb. All devices with active interrupts will respond with their client address as shown in [Table 4.6](#).

Table 4.6 Alert Response Address Protocol

| START | ALERT RESPONSE ADDRESS | RD | ACK | DEVICE ADDRESS | NACK | STOP |
|--------|------------------------|----|-----|----------------|------|--------|
| 1 -> 0 | 0001_100 | 1 | 0 | YYYY_YYY | 1 | 0 -> 1 |

The EMC1186 will respond to the ARA in the following way:

1. Send Slave Address and verify that full slave address was sent (i.e. the SMBus communication from the device was not prematurely stopped due to a bus contention event).
2. Set the MASK_ALL bit to clear the $\overline{\text{ALERT}}$ pin.

APPLICATION NOTE: The ARA does not clear the Status Register and if the MASK_ALL bit is cleared prior to the Status Register being cleared, the $\overline{\text{ALERT}}$ pin will be reasserted.

Chapter 5 Product Description

The is an SMBus temperature sensor with Hardware Thermal Shutdown. The EMC1186 monitors one internal diode and one externally connected temperature diode.

Thermal management is performed in cooperation with a host device. This consists of the host reading the temperature data of both the external and internal temperature diodes of the EMC1186 and using that data to control the speed of one or more fans.

The EMC1186 has two levels of monitoring. The first provides a maskable $\overline{\text{ALERT}}$ signal to the host when the measured temperatures exceeds user programmable limits. This allows the EMC1186 to be used as an independent thermal watchdog to warn the host of temperature hot spots without direct control by the host. The second level of monitoring asserts the $\overline{\text{SYS_SHDN}}$ pin when the External Diode 1 temperature exceeds a hardware specified threshold temperature. Additionally, the internal diode can be configured to assert the $\overline{\text{SYS_SHDN}}$ pin when the measured temperature exceeds user programmable limits.

Figure 5.1 shows a system level block diagram of the EMC1186.

Figure 5.1 System Diagram for EMC1186

5.1 Conversion Rates

The EMC1186 may be configured for different conversion rates based on the system requirements. The conversion rate is configured as described in Section 6.4. The default conversion rate is 4 conversions per second. Other available conversion rates are shown in Table 6.5, "Conversion Rate".

5.2 Dynamic Averaging

Dynamic averaging causes the EMC1186 to measure the external diode channels for an extended time based on the selected conversion rate. This functionality can be disabled for increased power savings at the lower conversion rates (see Section 6.3, "Configuration Register 03h / 09h"). When dynamic averaging is enabled, the device will automatically adjust the sampling and measurement time for the external diode channels. This allows the device to average 2x or 16x longer than the normal 11 bit operation (nominally 21ms per channel) while still maintaining the selected conversion rate. The benefits of dynamic averaging are improved noise rejection due to the longer integration time as well as less random variation of the temperature measurement.

When enabled, the dynamic averaging applies when a one-shot command is issued. The device will perform the desired averaging during the one-shot operation according to the selected conversion rate.

When enabled, the dynamic averaging will affect the average supply current based on the chosen conversion rate as shown in [Table 5.1](#).

Table 5.1 Supply Current vs. Conversion Rate for EMC1186

| CONVERSION RATE | AVERAGE SUPPLY CURRENT (TYPICAL) | | AVERAGING FACTOR (BASED ON 11-BIT OPERATION) | |
|-------------------|----------------------------------|----------|--|----------|
| | ENABLED (DEFAULT) | DISABLED | ENABLED (DEFAULT) | DISABLED |
| 1 / 16 sec | 210uA | 200uA | 16x | 1x |
| 1 / 8 sec | 265uA | 200uA | 16x | 1x |
| 1 / 4 sec | 330uA | 200uA | 16x | 1x |
| 1 / 2 sec | 395uA | 200uA | 16x | 1x |
| 1 / sec | 460uA | 215uA | 16x | 1x |
| 4 / sec (default) | 890uA | 325uA | 8x | 1x |
| 8 / sec | 1010uA | 630uA | 4x | 1x |
| 16 / sec | 1120uA | 775uA | 2x | 1x |
| 32 / sec | 1200uA | 1050uA | 1x | 1x |
| 64 / sec | 1400uA | 1100uA | 0.5x | 0.5x |

5.3 SYS_SHDN Output

The SYS_SHDN output is asserted independently of the ALERT output and cannot be masked. If the External Diode 1 temperature exceeds the Hardware Thermal Shutdown Limit for the programmed number of consecutive measurements, the SYS_SHDN pin is asserted.

The Hardware Thermal Shutdown Limit is defined at power-up via the pull-up resistors on the SYS_SHDN and ALERT pins as shown in [Table 5.2](#). This limit cannot be modified or masked via software.

In addition to External Diode 1 channel triggering the SYS_SHDN pin when the measured temperature exceeds to the Hardware Thermal Shutdown Limit, each of the measurement channels can be configured to assert the SYS_SHDN pin when they exceed the corresponding THERM Limit.

When the SYS_SHDN pin is asserted, it will not release until the External Diode 1 temperature drops below the Hardware Thermal Shutdown Limit minus 10°C and all other measured temperatures drop below the THERM Limit minus the THERM Hysteresis value (when linked to SYS_SHDN).

[Figure 5.2](#) shows a block diagram of the interaction between the input channels and the SYS_SHDN pin.

Figure 5.2 Block Diagram of Hardware Thermal Shutdown

5.4 Hardware Thermal Shutdown Limit

The Hardware Thermal Shutdown Limit temperature is determined by pull-up resistors on the SYS_SHDN and ALERT pins shown in Table 5.2.

Table 5.2 SYS_SHDN Threshold Temperature

| SYS_SHD PULL-UP ALERT PULL-UP | 4.7K OHM ±10% | 6.8K OHM ±10% | 10K OHM ±10% | 15K OHM ±10% | 22K OHM ±10% | 33K OHM ±10% |
|--|--------------------------|--------------------------|-------------------------|-------------------------|-------------------------|-------------------------|
| 4.7K OHM ±10% | 77°C | 83°C | 89°C | 95°C | 101°C | 107°C |
| 6.8K OHM ±10% | 78°C | 84°C | 90°C | 96°C | 102°C | 108°C |
| 10K OHM ±10% | 79°C | 85°C | 91°C | 97°C | 103°C | 109°C |
| 15K OHM ±10% | 80°C | 86°C | 92°C | 98°C | 104°C | 110°C |
| 22K OHM ±10% | 81°C | 87°C | 93°C | 99°C | 105°C | 111°C |
| 33K OHM ±10% | 82°C | 88°C | 94°C | 100°C | 106°C | 112°C |

5.5 **ALERT** Output

The **ALERT** pin is an open drain output and requires a pull-up resistor to V_{DD} and has two modes of operation: interrupt mode and comparator mode. The mode of the **ALERT** output is selected via the **ALERT / COMP** bit in the Configuration Register (see [Section 6.3](#)).

5.5.1 **ALERT** Pin Interrupt Mode

When configured to operate in interrupt mode, the **ALERT** pin asserts low when an out of limit measurement (\geq high limit or $<$ low limit) is detected on any diode or when a diode fault is detected, functioning as any standard **ALERT** in on the SMBus. The **ALERT** pin will remain asserted as long as an out-of-limit condition remains. Once the out-of-limit condition has been removed, the **ALERT** pin will remain asserted until the appropriate status bits are cleared.

The **ALERT** pin can be masked by setting the **MASK_ALL** bit. Once the **ALERT** pin has been masked, it will be de-asserted and remain de-asserted until the **MASK_ALL** bit is cleared by the user. Any interrupt conditions that occur while the **ALERT** pin is masked will update the Status Register normally. There are also individual channel masks (see [Section 6.10](#)).

The **ALERT** pin is used as an interrupt signal or as an SMBus Alert signal that allows an SMBus slave to communicate an error condition to the master. One or more **ALERT** outputs can be hard-wired together.

5.5.2 **ALERT** Pin Comparator Mode

When the **ALERT** pin is configured to operate in comparator mode, it will be asserted if any of the measured temperatures exceeds the respective high limit. The **ALERT** pin will remain asserted until all temperatures drop below the corresponding high limit minus the Therm Hysteresis value.

When the **ALERT** pin is asserted in comparator mode, the corresponding high limit status bits will be set. Reading these bits will not clear them until the **ALERT** pin is deasserted. Once the **ALERT** pin is deasserted, the status bits will be automatically cleared.

The **MASK_ALL** bit will not block the **ALERT** pin in this mode; however, the individual channel masks (see [Section 6.10](#)) will prevent the respective channel from asserting the **ALERT** pin.

5.6 **ALERT** and **SYS_SHDN** Pin Considerations

Because of the decode method used to determine the Hardware Thermal Shutdown Limit, it is important that the pull-up resistance on both the **ALERT** and **SYS_SHDN** pins be within the tolerances shown in [Table 5.2](#). Additionally, the pull-up resistor on the **ALERT** and **SYS_SHDN** pins must be connected to the same 3.3V supply that drives the **VDD** pin.

For 15ms after power up, the **ALERT** and **SYS_SHDN** pins must not be pulled low or the Hardware Thermal Shutdown Limit will not be decoded properly. If the system requirements do not permit these conditions, the **ALERT** and **SYS_SHDN** pins must be isolated from their respective busses during this time.

One method of isolating the **ALERT** pin is shown in [Figure 5.3](#).

Figure 5.3 Isolating ALERT and SYS_SHDN Pin

5.7 Temperature Measurement

The EMC1186 can monitor the temperature of one externally connected diodes.

The device contains programmable High, Low, and Therm limits for all measured temperature channels. If the measured temperature goes below the Low limit or above the High limit, the ALERT pin can be asserted (based on user settings).

5.7.1 Beta Compensation

The EMC1186 is configured to monitor the temperature of basic diodes (e.g., 2N3904) or CPU thermal diodes. For External Diode 1, it automatically detects the type of external diode (CPU diode or diode connected transistor) and determines the optimal setting to reduce temperature errors introduced by beta variation. Compensating for this error is also known as implementing the transistor or BJT model for temperature measurement.

For discrete transistors configured with the collector and base shorted together, the beta is generally sufficiently high such that the percent change in beta variation is very small. For example, a 10% variation in beta for two forced emitter currents with a transistor whose ideal beta is 50 would contribute approximately 0.25°C error at 100°C. However for substrate transistors where the base-emitter junction is used for temperature measurement and the collector is tied to the substrate, the proportional beta variation will cause large error. For example, a 10% variation in beta for two forced emitter currents with a transistor whose ideal beta is 0.5 would contribute approximately 8.25°C error at 100°C.

5.7.2 Resistance Error Correction (REC)

Parasitic resistance in series with the external diodes will limit the accuracy obtainable from temperature measurement devices. The voltage developed across this resistance by the switching diode currents cause the temperature measurement to read higher than the true temperature. Contributors to series resistance are PCB trace resistance, on die (i.e. on the processor) metal resistance, bulk resistance in the base and emitter of the temperature transistor. Typically, the error caused by series resistance is +0.7°C per ohm. The EMC1186 automatically corrects up to 100 ohms of series resistance.

5.7.3 Programmable External Diode Ideality Factor

The EMC1186 is designed for external diodes with an ideality factor of 1.008. Not all external diodes, processor or discrete, will have this exact value. This variation of the ideality factor introduces error in the temperature measurement which must be corrected for. This correction is typically done using programmable offset registers. Since an ideality factor mismatch introduces an error that is a function of temperature, this correction is only accurate within a small range of temperatures. To provide maximum flexibility to the user, the EMC1186 provides a 6-bit register for each external diode where the ideality factor of the diode used is programmed to eliminate errors across all temperatures.

APPLICATION NOTE: When monitoring a substrate transistor or CPU diode and beta compensation is enabled, the Ideality Factor should not be adjusted. Beta Compensation automatically corrects for most ideality errors.

5.8 Diode Faults

The EMC1186 detects an open on the DP and DN pins, and a short across the DP and DN pins. For each temperature measurement made, the device checks for a diode fault on the external diode channel(s). When a diode fault is detected, the ALERT pin asserts (unless masked, see [Section 5.9](#)) and the temperature data reads 00h in the MSB and LSB registers (note: the low limit will not be checked). A diode fault is defined as one of the following: an open between DP and DN, a short from V_{DD} to DP, or a short from V_{DD} to DN.

If a short occurs across DP and DN or a short occurs from DP to GND, the low limit status bit is set and the ALERT pin asserts (unless masked). This condition is indistinguishable from a temperature measurement of 0.000°C (-64°C in extended range) resulting in temperature data of 00h in the MSB and LSB registers.

If a short from DN to GND occurs (with a diode connected), temperature measurements will continue as normal with no alerts.

5.9 Consecutive Alerts

The EMC1186 contain multiple consecutive alert counters. One set of counters applies to the ALERT pin and the second set of counters applies to the SYS_SHDN pin. Each temperature measurement channel has a separate consecutive alert counter for each of the ALERT and SYS_SHDN pins. All counters are user programmable and determine the number of consecutive measurements that a temperature channel(s) must be out-of-limit or reporting a diode fault before the corresponding pin is asserted.

See [Section 6.11, "Consecutive ALERT Register 22h"](#) for more details on the consecutive alert function.

5.10 Digital Filter

To reduce the effect of noise and temperature spikes on the reported temperature, the External Diode 1 channel uses a programmable digital filter. This filter can be configured as Level 1, Level 2, or Disabled (default) (see [Section 6.13](#)). The typical filter performance is shown in [Figure 5.4](#) and [Figure 5.5](#).

Figure 5.4 Temperature Filter Step Response

Figure 5.5 Temperature Filter Impulse Response

5.11 Temperature Measurement Results and Data

The temperature measurement results are stored in the internal and external temperature registers. These are then compared with the values stored in the high and low limit registers. Both external and internal temperature measurements are stored in 11-bit format with the eight (8) most significant bits stored in a high byte register and the three (3) least significant bits stored in the three (3) MSB positions of the low byte register. All other bits of the low byte register are set to zero.

The EMC1186 has two selectable temperature ranges. The default range is from 0°C to +127°C and the temperature is represented as binary number able to report a temperature from 0°C to +127.875°C in 0.125°C steps.

The extended range is an extended temperature range from -64°C to +191°C. The data format is a binary number offset by 64°C. The extended range is used to measure temperature diodes with a large known offset (such as AMD processor diodes) where the diode temperature plus the offset would be equivalent to a temperature higher than +127°C.

Table 5.3 shows the default and extended range formats.

Table 5.3 Temperature Data Format

| TEMPERATURE (°C) | DEFAULT RANGE 0°C TO 127°C | EXTENDED RANGE -64°C TO 191°C |
|------------------|----------------------------|-------------------------------|
| Diode Fault | 000 0000 0000 | 000 0000 0000 |
| -64 | 000 0000 0000 | 000 0000 0000 |
| -1 | 000 0000 0000 | 001 1111 1000 |
| 0 | 000 0000 0000 | 010 0000 0000 |
| 0.125 | 000 0000 0001 | 010 0000 0001 |
| 1 | 000 0000 1000 | 010 0000 1000 |
| 64 | 010 0000 0000 | 100 0000 0000 |
| 65 | 010 0000 1000 | 100 0000 1000 |
| 127 | 011 1111 1000 | 101 1111 1000 |
| 127.875 | 011 1111 1111 | 101 1111 1111 |
| 128 | 011 1111 1111 | 110 0000 0000 |
| 190 | 011 1111 1111 | 111 1111 0000 |
| 191 | 011 1111 1111 | 111 1111 1000 |
| >= 191.875 | 011 1111 1111 | 111 1111 1111 |

Chapter 6 Register Description

The registers shown in [Table 6.1](#) are accessible through the SMBus. An entry of '-' indicates that the bit is not used and will always read '0'.

Table 6.1 Register Set in Hexadecimal Order

| REGISTER ADDRESS | R/W | REGISTER NAME | FUNCTION | DEFAULT VALUE | PAGE |
|------------------|-----|---------------------------------------|--|---------------|---------|
| 00h | R | Internal Diode Data High Byte | Stores the integer data for the Internal Diode | 00h | Page 27 |
| 01h | R | External Diode 1 Data High Byte | Stores the integer data for External Diode 1 | 00h | |
| 03h | R/W | Configuration | Controls the general operation of the device (mirrored at address 09h) | 00h | Page 28 |
| 04h | R/W | Conversion Rate | Controls the conversion rate for updating temperature data (mirrored at address 0Ah) | 06h (4/sec) | Page 29 |
| 05h | R/W | Internal Diode High Limit | Stores the 8-bit high limit for the Internal Diode (mirrored at address 0Bh) | 55h (85°C) | Page 29 |
| 06h | R/W | Internal Diode Low Limit | Stores the 8-bit low limit for the Internal Diode (mirrored at address 0Ch) | 00h (0°C) | |
| 07h | R/W | External Diode 1 High Limit High Byte | Stores the integer portion of the high limit for External Diode 1 (mirrored at register 0Dh) | 55h (85°C) | |
| 08h | R/W | External Diode 1 Low Limit High Byte | Stores the integer portion of the low limit for External Diode 1 (mirrored at register 0Eh) | 00h (0°C) | |
| 09h | R/W | Configuration | Controls the general operation of the device (mirrored at address 03h) | 00h | Page 28 |
| 0Ah | R/W | Conversion Rate | Controls the conversion rate for updating temperature data (mirrored at address 04h) | 06h (4/sec) | Page 29 |

Table 6.1 Register Set in Hexadecimal Order (continued)

| REGISTER ADDRESS | R/W | REGISTER NAME | FUNCTION | DEFAULT VALUE | PAGE |
|------------------|-----|---------------------------------------|--|---------------|---------|
| 0Bh | R/W | Internal Diode High Limit | Stores the 8-bit high limit for the Internal Diode (mirrored at address 05h) | 55h (85°C) | Page 29 |

6.1 Data Read Interlock

When any temperature channel high byte register is read, the corresponding low byte is copied into an internal 'shadow' register. The user is free to read the low byte at any time and be guaranteed that it will correspond to the previously read high byte. Regardless if the low byte is read or not, reading from the same high byte register again will automatically refresh this stored low byte data.

6.2 Temperature Data Registers

Table 6.2 Temperature Data Registers

| ADDR | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|------|-----|----------------------------|-----|------|-------|----|----|----|----|----|---------|
| 00h | R | Internal Diode High Byte | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 | 00h |
| 29h | R | Internal Diode Low Byte | 0.5 | 0.25 | 0.125 | - | - | - | - | - | 00h |
| 01h | R | External Diode 1 High Byte | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 | 00h |
| 10h | R | External Diode 1 Low Byte | 0.5 | 0.25 | 0.125 | - | - | - | - | - | 00h |

As shown in [Table 6.2](#), all temperatures are stored as an 11-bit value with the high byte representing the integer value and the low byte representing the fractional value left justified to occupy the MSBits.

Bit 0 - HWSD - This bit is set when the External Diode 1 Temperature exceeds the Hardware Thermal Shutdown Limit set by the pull-up resistors on the $\overline{\text{ALERT}}$ and $\overline{\text{SYS_SHDN}}$ pins. When set, this bit will assert the $\overline{\text{SYS_SHDN}}$ pin.

6.3 Configuration Register 03h / 09h

Table 6.3 Configuration Register

| ADDR | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|------|-----|---------------|-----------|-----------|-------------|-------|----|-------|-----------|----|---------|
| 03h | R/W | Configuration | MASK_ ALL | RUN/ STOP | ALERT/ COMP | RECD1 | - | RANGE | DAVG_ DIS | | 00h |
| 09h | | | | | | | | | | | |

The Configuration Register controls the basic operation of the device. This register is fully accessible at either address.

Bit 7 - MASK_ALL - Masks the $\overline{\text{ALERT}}$ pin from asserting.

- '0' - (default) - The $\overline{\text{ALERT}}$ pin is not masked. If any of the appropriate status bits are set the $\overline{\text{ALERT}}$ pin will be asserted.
- '1' - The $\overline{\text{ALERT}}$ pin is masked. It will not be asserted for any interrupt condition unless it is configured in comparator mode. The Status Registers will be updated normally.

Bit 6 - RUN / STOP - Controls Active/Standby modes.

- '0' (default) - The device is in Active mode and converting on all channels.
- '1' - The device is in Standby mode and not converting.

Bit 5 - ALERT/COMP - Controls the operation of the $\overline{\text{ALERT}}$ pin.

- '0' (default) - The $\overline{\text{ALERT}}$ acts as an Alert pin and has interrupt behavior as described in [Section 5.5.1](#).
- '1' - The $\overline{\text{ALERT}}$ acts as a THERM pin and has comparator behavior as described in [Section 5.5.2](#). In this mode the MASK_ALL bit is ignored.

Bit 4 - RECD1 - Disables the Resistance Error Correction (REC) for External Diode 1.

- '0' (default) - REC is enabled for External Diode 1.
- '1' - REC is disabled for External Diode 1.

Bit 2 - RANGE - Configures the measurement range and data format of the temperature channels.

- '0' (default) - The temperature measurement range is 0°C to +127.875°C and the data format is binary.
- '1' - The temperature measurement range is -64°C to +191.875°C and the data format is offset binary (see [Table 5.3](#)).

Bit 1 - DAVG_DIS - Disables the dynamic averaging feature on all temperature channels.

- '0' (default) - The dynamic averaging feature is enabled. All temperature channels will be converted with an averaging factor that is based on the conversion rate as shown in [Table 6.5](#).
- '1' - The dynamic averaging feature is disabled. All temperature channels will be converted with a maximum averaging factor of 1x (equivalent to 11-bit conversion). For higher conversion rates, this averaging factor will be reduced as shown in [Table 6.5](#).

6.4 Conversion Rate Register 04h / 0Ah

Table 6.4 Conversion Rate Register

| ADDR | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|------|-----|-----------------|----|----|----|----|-----------|----|----|----|----------------|
| 04h | R/W | Conversion Rate | - | - | - | - | CONV[3:0] | | | | 06h (4/sec) |
| 0Ah | | | | | | | | | | | |

The Conversion Rate Register controls how often the temperature measurement channels are updated and compared against the limits. This register is fully accessible at either address.

Bits 3-0 - CONV[3:0] - Determines the conversion rate as shown in [Table 6.5](#).

Table 6.5 Conversion Rate

| CONV[3:0] | | | | | CONVERSIONS / SECOND |
|-----------|------------|---|---|---|----------------------|
| HEX | 3 | 2 | 1 | 0 | |
| 0h | 0 | 0 | 0 | 0 | 1 |
| 1h | 0 | 0 | 0 | 1 | 1 |
| 2h | 0 | 0 | 1 | 0 | 1 |
| 3h | 0 | 0 | 1 | 1 | 1 |
| 4h | 0 | 1 | 0 | 0 | 1 |
| 5h | 0 | 1 | 0 | 1 | 2 |
| 6h | 0 | 1 | 1 | 0 | 4 (default) |
| 7h | 0 | 1 | 1 | 1 | 8 |
| 8h | 1 | 0 | 0 | 0 | 16 |
| 9h | 1 | 0 | 0 | 1 | 32 |
| Ah | 1 | 0 | 1 | 0 | 64 |
| Bh - Fh | All others | | | | 1 |

6.5 Limit Registers

Table 6.6 Temperature Limit Registers

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|---------------------------|-----|----|----|----|----|----|----|----|---------------|
| 05h | R/W | Internal Diode High Limit | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 | 55h (85°C) |
| 0Bh | | | | | | | | | | | |

Table 6.6 Temperature Limit Registers (continued)

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|---------------------------------------|-----|------|-------|----|----|----|----|----|------------|
| 06h | R/W | Internal Diode Low Limit | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 | 00h (0°C) |
| 0Ch | | | | | | | | | | | |
| 07h | R/W | External Diode 1 High Limit High Byte | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 | 55h (85°C) |
| 0Dh | | | | | | | | | | | |
| 13h | R/W | External Diode 1 High Limit Low Byte | 0.5 | 0.25 | 0.125 | - | - | - | - | - | 00h |
| 08h | R/W | External Diode 1 Low Limit High Byte | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 | 00h (0°C) |
| 0Eh | | | | | | | | | | | |
| 14h | R/W | External Diode 1 Low Limit Low Byte | 0.5 | 0.25 | 0.125 | - | - | - | - | - | 00h |

The device contains both high and low limits for all temperature channels. If the measured temperature exceeds the high limit, then the corresponding status bit is set and the $\overline{\text{ALERT}}$ pin is asserted. Likewise, if the measured temperature is less than or equal to the low limit, the corresponding status bit is set and the $\overline{\text{ALERT}}$ pin is asserted.

The data format for the limits must match the selected data format for the temperature so that if the extended temperature range is used, the limits must be programmed in the extended data format.

The limit registers with multiple addresses are fully accessible at either address.

6.6 Scratchpad Registers 11h and 12h

Table 6.7 Scratchpad Register

| ADDR | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|------|-----|------------|----|----|----|----|----|----|----|----|---------|
| 11h | R/W | Scratchpad | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 00h |
| 12h | R/W | Scratchpad | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 00h |

The Scratchpad Registers are Read / Write registers that are used for place holders to be software compatible with legacy programs. Reading from the registers will return what is written to them.

6.7 Therm Limit Registers

Table 6.8 Therm Limit Registers

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|------------------------------|-----|----|----|----|----|----|----|----|------------|
| 19h | R/W | External Diode 1 Therm Limit | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 | 55h (85°C) |
| 20h | R/W | Internal Diode Therm Limit | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 | 55h (85°C) |
| 21h | R/W | Therm Hysteresis | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 | 0Ah (10°C) |

The Therm Limit Registers are used to determine whether a critical thermal event has occurred. If the measured temperature exceeds the Therm Limit, the $\overline{\text{SYS_SHDN}}$ pin will be asserted (if the corresponding measurement channel is linked to the $\overline{\text{SYS_SHDN}}$ pin - see [Section 6.8, "Software Thermal Shutdown Configuration Register 1Dh"](#)). The limit setting must match the chosen data format of the temperature reading registers.

6.8 Software Thermal Shutdown Configuration Register 1Dh

Table 6.9 Software Thermal Shutdown Configuration Register

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|---|----|----|----|----|----|----|--------|--------|---------|
| 1Dh | R/W | Software Thermal Shutdown Configuration | - | - | - | - | - | - | EXTSYS | INTSYS | 00h |

The Software Thermal Shutdown Configuration Register controls whether any of the software channels will assert the $\overline{\text{SYS_SHDN}}$ pin. If a channel is enabled, the temperature is compared against the corresponding Therm Limit. If the measured temperature exceeds the Therm Limit, the $\overline{\text{SYS_SHDN}}$ pin is asserted. This functionality is in addition to the Hardware Shutdown circuitry.

Bit 1 - EXT1SYS - configures the External Diode 1 channel to assert the $\overline{\text{SYS_SHDN}}$ pin based on its Therm Limit.

- '0' (default) - The External Diode 1 channel is not linked to the $\overline{\text{SYS_SHDN}}$ pin. If the temperature exceeds the Therm Limit, the E1THERM status bit is set but the $\overline{\text{SYS_SHDN}}$ pin is not asserted.
- '1' - The External Diode 1 channel is linked to the $\overline{\text{SYS_SHDN}}$ pin. If the temperature exceeds its Therm Limit, the E1THERM status bit is set and the $\overline{\text{SYS_SHDN}}$ pin is asserted. It will remain asserted until the temperature drops below its Therm Limit minus the Therm Hysteresis.

Bit 0 - INTSYS - Configures the Internal Diode channel to assert the $\overline{\text{SYS_SHDN}}$ pin based on its Therm Limit.

- '0' (default) - The Internal Diode channel is not linked to the $\overline{\text{SYS_SHDN}}$ pin. If the temperature exceeds its Therm Limit, the ITHERM status bit is set but the $\overline{\text{SYS_SHDN}}$ pin is not asserted.
- '1' - The Internal Diode channel is linked to the $\overline{\text{SYS_SHDN}}$ pin. If the temperature exceeds its Therm Limit, the ITHERM status bit is set and the $\overline{\text{SYS_SHDN}}$ pin is asserted. It will remain asserted until the temperature drops below its Therm Limit minus the Therm Hysteresis.

6.9 Hardware Thermal Shutdown Limit Register 1Eh

Table 6.10 Hardware Thermal Shutdown Limit Register

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|---------------------------------|-----|----|----|----|----|----|----|----|---------|
| 1Eh | R | Hardware Thermal Shutdown Limit | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 | N/A |

This read only register returns the Hardware Thermal Shutdown Limit selected by the value of the pull-up resistors on the $\overline{\text{ALERT}}$ and $\overline{\text{SYS_SHDN}}$ pins. The data represents the hardware set temperature in °C using the active temperature setting set by the RANGE bit in the Configuration Register. See [Table 5.3, "Temperature Data Format"](#) for the data format.

When the External Diode 1 Temperature exceeds this limit, the $\overline{\text{SYS_SHDN}}$ pin is asserted and will remain asserted until the External Diode 1 Temperature drops below this limit minus 10°C.

6.10 Channel Mask Register 1Fh

Table 6.11 Channel Mask Register

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|--------------|----|----|----|----|----|----|----------|----------|---------|
| 1Fh | R/W | Channel Mask | - | - | - | - | - | - | EXT MASK | INT MASK | 00h |

The Channel Mask Register controls individual channel masking. When a channel is masked, the $\overline{\text{ALERT}}$ pin will not be asserted when the masked channel reads a diode fault or out of limit error. The channel mask does not mask the $\overline{\text{SYS_SHDN}}$ pin.

Bit 1 - EXTMASK - Masks the $\overline{\text{ALERT}}$ pin from asserting when the External Diode channel is out of limit or reports a diode fault.

- '0' (default) - The External Diode channel will cause the $\overline{\text{ALERT}}$ pin to be asserted if it is out of limit or reports a diode fault.
- '1' - The External Diode channel will not cause the $\overline{\text{ALERT}}$ pin to be asserted if it is out of limit or reports a diode fault.

Bit 0 - INTMASK - Masks the $\overline{\text{ALERT}}$ pin from asserting when the Internal Diode temperature is out of limit.

- '0' (default) - The Internal Diode channel will cause the $\overline{\text{ALERT}}$ pin to be asserted if it is out of limit.
- '1' - The Internal Diode channel will not cause the $\overline{\text{ALERT}}$ pin to be asserted if it is out of limit.

6.11 Consecutive ALERT Register 22h

Table 6.12 Consecutive ALERT Register

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|-------------------|----------|------------|----|----|------------|----|----|----|---------|
| 22h | R/W | Consecutive ALERT | TIME OUT | CTHRM[2:0] | | | CALRT[2:0] | | | - | 70h |

The Consecutive ALERT Register determines how many times an out-of-limit error or diode fault must be detected in consecutive measurements before the $\overline{\text{ALERT}}$ or $\overline{\text{SYS_SHDN}}$ pin is asserted. Additionally, the Consecutive ALERT Register controls the SMBus Timeout functionality.

An out-of-limit condition (i.e. HIGH, LOW, or FAULT) occurring on the same temperature channel in consecutive measurements will increment the consecutive alert counter. The counters will also be reset if no out-of-limit condition or diode fault condition occurs in a consecutive reading.

When the $\overline{\text{ALERT}}$ pin is configured as an interrupt, when the consecutive alert counter reaches its programmed value, the following will occur: the $\overline{\text{STATUS}}$ bit(s) for that channel and the last error condition(s) (i.e. EHIGH,) will be set to '1', the $\overline{\text{ALERT}}$ pin will be asserted, the consecutive alert counter will be cleared, and measurements will continue.

When the $\overline{\text{ALERT}}$ pin is configured as a comparator, the consecutive alert counter will ignore diode fault and low limit errors and only increment if the measured temperature exceeds the High Limit. Additionally, once the consecutive alert counter reaches the programmed limit, the $\overline{\text{ALERT}}$ pin will be asserted, but the counter will not be reset. It will remain set until the temperature drops below the High Limit minus the Therm Hysteresis value.

For example, if the CALRT[2:0] bits are set for 4 consecutive alerts on an EMC1186 device, the high limits are set at 70°C, and none of the channels are masked, the $\overline{\text{ALERT}}$ pin will be asserted after the following four measurements:

1. Internal Diode reads 71°C and the external diode reads 69°C. Consecutive alert counter for INT is incremented to 1.
2. Both the Internal Diode and the External Diode read 71°C. Consecutive alert counter for INT is incremented to 2 and for EXT1 is set to 1.
3. The External Diode reads 71°C and the Internal Diode reads 69°C. Consecutive alert counters for INT is cleared and EXT is incremented to 2.
4. The Internal Diode reads 71°C and the external diode reads 71°C. Consecutive alert counter for INT is set to 1, and EXT1 is incremented to 3.
5. The Internal Diode reads 71°C and the external diodes read 71°C. Consecutive alert counter for INT is incremented to 2, and EXT1 is incremented to 4. The appropriate status bits are set for EXT1 and the $\overline{\text{ALERT}}$ pin is asserted. EXT1 counter is reset to 0 and all other counters hold the last value until the next temperature measurement.

Bit 7 - TIMEOUT - Determines whether the SMBus Timeout function is enabled.

- '0' (default) - The SMBus Timeout feature is disabled. The SMCLK line can be held low indefinitely without the device resetting its SMBus protocol.
- '1' - The SMBus Timeout feature is enabled. If the SMCLK line is held low for more than t_{TIMEOUT} , the device will reset the SMBus protocol.

Bits 6-4 CTHRM[2:0] - Determines the number of consecutive measurements that must exceed the corresponding Therm Limit and Hardware Thermal Shutdown Limit before the $\overline{\text{SYS_SHDN}}$ pin is asserted. All temperature channels use this value to set the respective counters. The consecutive THERM counter is incremented whenever any of the measurements exceed the corresponding Therm Limit or if the External Diode 1 measurement exceeds the Hardware Thermal Shutdown Limit.

If the temperature drops below the Therm Limit or Hardware Thermal Shutdown Limit, the counter is reset. If the programmed number of consecutive measurements exceed the Therm Limit or Hardware Thermal Shutdown Limit, and the appropriate channel is linked to the SYS_SHDN pin, the SYS_SHDN pin will be asserted low.

Once the $\overline{\text{SYS_SHDN}}$ pin is asserted, the consecutive Therm counter will not reset until the corresponding temperature drops below the appropriate limit minus the corresponding hysteresis.

The bits are decoded as shown in [Table 6.13](#). The default setting is 4 consecutive out of limit conversions.

Bits 3-1 - CALRT[2:0] - Determine the number of consecutive measurements that must have an out of limit condition or diode fault before the ALERT pin is asserted. All temperature channels use this value to set the respective counters. The bits are decoded as shown in [Table 6.13](#). The default setting is 1 consecutive out of limit conversion.

Table 6.13 Consecutive Alert / Therm Settings

| 2 | 1 | 0 | NUMBER OF CONSECUTIVE OUT OF LIMIT MEASUREMENTS |
|---|---|---|---|
| 0 | 0 | 0 | 1 (default for CALRT[2:0]) |
| 0 | 0 | 1 | 2 |
| 0 | 1 | 1 | 3 |
| 1 | 1 | 1 | 4 (default for CTHRM[2:0]) |

6.12 External Diode Ideality Factor Registers 27h to 31h

Table 6.14 Ideality Configuration Registers

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|----------------------------------|----|----|----------------|----|----|----|----|----|---------|
| 27h | R/W | External Diode 1 Ideality Factor | - | - | IDEALITY1[5:0] | | | | | | 12h |

These registers store the ideality factors that are applied to the external diodes. [Table 6.15](#) defines each setting and the corresponding ideality factor. Beta Compensation and Resistance Error Correction automatically correct for most diode ideality errors; therefore, it is not recommended that these settings be updated without consulting SMSC.

Table 6.15 Ideality Factor Look-Up Table (Diode Model)

| SETTING | FACTOR | SETTING | FACTOR | SETTING | FACTOR |
|---------|--------|---------|--------|---------|--------|
| 08h | 0.9949 | 18h | 1.0159 | 28h | 1.0371 |
| 09h | 0.9962 | 19h | 1.0172 | 29h | 1.0384 |
| 0Ah | 0.9975 | 1Ah | 1.0185 | 2Ah | 1.0397 |
| 0Bh | 0.9988 | 1Bh | 1.0200 | 2Bh | 1.0410 |
| 0Ch | 1.0001 | 1Ch | 1.0212 | 2Ch | 1.0423 |
| 0Dh | 1.0014 | 1Dh | 1.0226 | 2Dh | 1.0436 |
| 0Eh | 1.0027 | 1Eh | 1.0239 | 2Eh | 1.0449 |
| 0Fh | 1.0040 | 1Fh | 1.0253 | 2Fh | 1.0462 |
| 10h | 1.0053 | 20h | 1.0267 | 30h | 1.0475 |
| 11h | 1.0066 | 21h | 1.0280 | 31h | 1.0488 |
| 12h | 1.0080 | 22h | 1.0293 | 32h | 1.0501 |
| 13h | 1.0093 | 23h | 1.0306 | 33h | 1.0514 |
| 14h | 1.0106 | 24h | 1.0319 | 34h | 1.0527 |
| 15h | 1.0119 | 25h | 1.0332 | 35h | 1.0540 |
| 16h | 1.0133 | 26h | 1.0345 | 36h | 1.0553 |
| 17h | 1.0146 | 27h | 1.0358 | 37h | 1.0566 |

For CPU substrate transistors that require the BJT transistor model, the ideality factor behaves slightly differently than for discrete diode-connected transistors. Refer to [Table 6.16](#) when using a CPU substrate transistor.

Table 6.16 Substrate Diode Ideality Factor Look-Up Table (BJT Model)

| SETTING | FACTOR | SETTING | FACTOR | SETTING | FACTOR |
|---------|--------|---------|--------|---------|--------|
| 08h | 0.9869 | 18h | 1.0079 | 28h | 1.0291 |
| 09h | 0.9882 | 19h | 1.0092 | 29h | 1.0304 |
| 0Ah | 0.9895 | 1Ah | 1.0105 | 2Ah | 1.0317 |
| 0Bh | 0.9908 | 1Bh | 1.0120 | 2Bh | 1.0330 |
| 0Ch | 0.9921 | 1Ch | 1.0132 | 2Ch | 1.0343 |
| 0Dh | 0.9934 | 1Dh | 1.0146 | 2Dh | 1.0356 |
| 0Eh | 0.9947 | 1Eh | 1.0159 | 2Eh | 1.0369 |
| 0Fh | 0.9960 | 1Fh | 1.0173 | 2Fh | 1.0382 |

Table 6.16 Substrate Diode Ideality Factor Look-Up Table (BJT Model) (continued)

| SETTING | FACTOR | SETTING | FACTOR | SETTING | FACTOR |
|---------|--------|---------|--------|---------|--------|
| 10h | 0.9973 | 20h | 1.0187 | 30h | 1.0395 |
| 11h | 0.9986 | 21h | 1.0200 | 31h | 1.0408 |
| 12h | 1.0000 | 22h | 1.0213 | 32h | 1.0421 |
| 13h | 1.0013 | 23h | 1.0226 | 33h | 1.0434 |
| 14h | 1.0026 | 24h | 1.0239 | 34h | 1.0447 |
| 15h | 1.0039 | 25h | 1.0252 | 35h | 1.0460 |
| 16h | 1.0053 | 26h | 1.0265 | 36h | 1.0473 |
| 17h | 1.0066 | 27h | 1.0278 | 37h | 1.0486 |

APPLICATION NOTE: When measuring a 65nm Intel CPU, the Ideality Setting should be the default 12h. When measuring a 45nm Intel CPU, the Ideality Setting should be 15h.

Bit 1 - E1HIGH - This bit is set when the External Diode 1 channel exceeds its programmed high limit.

Bit 0 - IHIGH - This bit is set when the Internal Diode channel exceeds its programmed high limit.

Bit 1 - ELOW - This bit is set when the External Diode channel drops below its programmed low limit.

Bit 0 - ILOW - This bit is set when the Internal Diode channel drops below its programmed low limit.

Bit 1 - ETHERM - This bit is set when the External Diode channel exceeds its programmed Therm Limit. When set, this bit will assert the $\overline{\text{THERM}}$ pin.

Bit 0 - ITHERM - This bit is set when the Internal Diode channel exceeds its programmed Therm Limit. When set, this bit will assert the $\overline{\text{THERM}}$ pin.

6.13 Filter Control Register 40h

Table 6.17 Filter Configuration Register

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|----------------|----|----|----|----|----|----|-------------|----|---------|
| 40h | R/W | Filter Control | - | - | - | - | - | - | FILTER[1:0] | | 00h |

The Filter Configuration Register controls the digital filter on the External Diode 1 channel.

Bits 1-0 - FILTER[1:0] - Control the level of digital filtering that is applied to the External Diode 1 temperature measurement as shown in [Table 6.18](#). See [Figure 5.4](#) and [Figure 5.5](#) for examples on the filter behavior.

Table 6.18 FILTER Decode

| FILTER[1:0] | | AVERAGING |
|-------------|---|--------------------|
| 1 | 0 | |
| 0 | 0 | Disabled (default) |
| 0 | 1 | Level 1 |
| 1 | 0 | Level 1 |
| 1 | 1 | Level 2 |

6.14 Product ID Register

Table 6.19 Product ID Register

| ADDR | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|------|-----|------------|----|----|----|----|----|----|----|----|---------|
| FDh | R | Product ID | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 22h |

The Product ID Register holds a unique value that identifies the device.

6.15 SMSC ID Register

Table 6.20 Manufacturer ID Register

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|----------|----|----|----|----|----|----|----|----|---------|
| FEh | R | SMSC ID | 0 | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 5Dh |

The Manufacturer ID register contains an 8-bit word that identifies the SMSC as the manufacturer of the EMC1186.

6.16 Revision Register

Table 6.21 Revision Register

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|----------|----|----|----|----|----|----|----|----|---------|
| FFh | R | Revision | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 07h |

The Revision register contains an 8-bit word that identifies the die revision.

Chapter 7 Typical Operating Curves

Chapter 8 Package Information

Figure 8.1 2mm x 3mm TDFN Package Drawing

| COMMON DIMENSIONS | | | | | |
|-------------------|----------|------|------|------|-----------------------------|
| SYMBOL | MIN | NOM | MAX | NOTE | REMARK |
| A | 0.70 | 0.75 | 0.80 | - | OVERALL PACKAGE HEIGHT |
| A1 | 0 | 0.02 | 0.05 | - | STANDOFF |
| D | 1.90 | 2.00 | 2.10 | - | X BODY SIZE |
| E | 2.90 | 3.00 | 3.10 | - | Y BODY SIZE |
| D2 | 1.40 | 1.50 | 1.60 | 2 | X EXPOSED PAD SIZE |
| E2 | 1.60 | 1.70 | 1.80 | 2 | Y EXPOSED PAD SIZE |
| L | 0.35 | 0.40 | 0.45 | - | TERMINAL LENGTH |
| b | 0.18 | 0.25 | 0.30 | 2 | TERMINAL WIDTH |
| K | 0.20 | 0.25 | - | - | CENTER PAD TO PIN CLEARANCE |
| e | 0.50 BSC | | | - | TERMINAL PITCH |

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. UNILATERAL COPLANARITY ZONE APPLIES TO THE EXPOSED PAD, AS WELL AS THE TERMINALS. DIMENSIONS "b" APPLIES TO PLATED TERMINALS AND IT IS MEASURED BETWEEN 0.15 AND 0.30 mm FROM THE TERMINAL TIP.
3. DETAILS OF TERMINAL #1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE AREA INDICATED.
