

ES9010K2M

Premier Stereo Low Power Audio DAC

Datasheet

The **ES9010K2M SABRE® Premier DAC** is a high-performance 32-bit, 2-channel audio D/A converter targeted for portable high-fidelity audio applications such as digital music players, consumer applications such as Blu-ray players, audio pre-amplifiers and A/V receivers, as well as professional applications such as recording systems, mixer consoles and digital audio workstations.

Using the critically acclaimed ESS patented HyperStream® DAC architecture and Time Domain Jitter Eliminator, the **ES9010K2M SABRE® Premier DAC** delivers a DNR of up to 116dB and THD+N of -106dB, a performance level that will satisfy the most demanding audio enthusiasts.

The **ES9010K2M SABRE® Premier DAC's** HyperStream® architecture can handle up to 32-bit, 384kHz PCM data via I²S, DSD-11.2MHz data as well as mono mode for highest performance applications. Both synchronous and ASRC (asynchronous sample rate conversion) modes are supported.

The **ES9010K2M SABRE® Premier DAC** is powered by a single VCCA supply, with internal regulators generating the core and analog supplies. The DAC comes in a 28-QFN package, supports 1.8V logic levels and consumes less than 40mW in normal operation mode (< 1mW in standby mode).

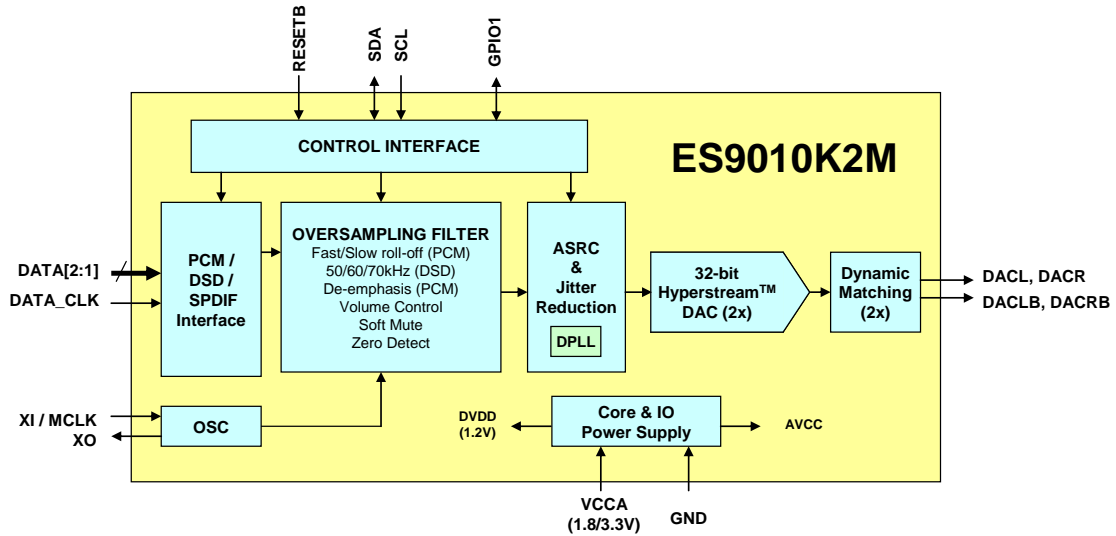

FEATURE	DESCRIPTION
Patented 32-bit HyperStream® DAC <ul style="list-style-type: none"> +116B DNR -106dB THD+N 	<ul style="list-style-type: none"> 32-bit audio DAC powered by Sabre^{32®} DAC architecture with ultra high dynamic range and low distortion Supports both synchronous and ASRC (asynchronous sample rate converter) modes
Patented Time Domain Jitter Eliminator SABRE SOUND® technology	<ul style="list-style-type: none"> Unmatched audio clarity free from input clock jitter HD Audio Performance
Integrated DSP Functions	<ul style="list-style-type: none"> Click-free soft mute and volume control Programmable Zero detect De-emphasis for 32kHz, 44.1kHz, and 48kHz sampling
Customizable output configuration	<ul style="list-style-type: none"> Current or voltage mode based on performance criterion
I ² C control	<ul style="list-style-type: none"> Allows software control of DAC features

3	SCL	I	Tri-stated	I ² C Serial Clock Input
4	SDA	I/O	Tri-stated	I ² C Serial Data Input/Output
5	ADDR	I	Tri-stated	I ² C Address Select
6	XO	AO	Floating	XTAL Out
7	XI (MCLK)	AI	Floating	XTAL / MCLK In
8	N.C.	-	-	No internal connection. Pin may be grounded if desired.
9	DACR	AO	Driven to ground	Differential Positive Analog Output Right
10	DACRB	AO	Driven to ground	Differential Negative Analog Output Right
11	N.C.	-	-	No internal connection. Pin may be grounded if desired.
12	AGND	Ground	Ground	Analog Ground
13	DACL	AO	Driven to ground	Differential Positive Analog Output Left
14	DACLB	AO	Driven to ground	Differential Negative Analog Output Left
15	N.C.	-	-	No internal connection. Pin may be grounded if desired.
16	VREF	-	-	Reference Voltage (Decoupling)
17	VREG	Power	Power	Analog supply from internal regulator (Decoupling)
18	VCCA	Power	Power	Analog +1.8V to +3.3V
19	N.C.	-	-	No internal connection. Pin may be grounded if desired.
20	DGND	Ground	Ground	Digital Ground
21	DVDD	Power (Internal / External)	Power	Digital Core Voltage, nominally +1.2V, is supplied by a regulator from VCCA. DVDD must be decoupled with a minimum 4.7 μ F capacitor to DGND for stable operation. DVDD needs to be externally supplied for high XI / MCLK frequency. Please refer to the section about the DVDD supply on page 7 for additional information.
22	N.C.	-	-	No internal connection. Pin may be grounded if desired.
23	N.C.	-	-	No internal connection. Pin may be grounded if desired.
24	GPIO1	I/O	Tri-stated	GPIO 1
25	DATA2	I	Tri-stated	DSD Data2 (R) OR PCM Data CH1/CH2 or SPDIF Input 2
26	DATA1	I/O	Tri-stated	Master mode off: Input for DSD Data1 (L) OR PCM Frame Clock or SPDIF Input 3 Master mode on: Output for PCM Frame Clock
27	DATA_CLK	I/O	Tri-stated	Master mode off: Input for PCM Bit Clock OR DSD Bit Clock OR SPDIF Input 1 Master mode on: Output for PCM Bit Clock
28	RESETB	I	Tri-stated	Master Reset / Power Down (active low)
Exposed Pad	DGND	Ground	Ground	The exposed pad must be connected to Digital Ground

Notes:

- There are 7 N.C. (No Connect) pins. If desired, these pins can be connected to ground on the PCB to strengthen the otherwise isolated pin pads.
- The exposed pad must be connected to digital ground.

ES9010K2M Datasheet

FUNCTIONAL DESCRIPTION

NOTATIONS for Sampling Rates

Mode	fs (target sample rate)	FSR (raw sample rate)
DSD	DATA_CLK / 64	DSD data rate
Serial (PCM) Normal Mode	Frame Clock Rate	Frame Clock Rate
Serial (PCM) OSF Bypass Mode	Frame Clock Rate / 8	Frame Clock Rate
SPDIF	SPDIF Sampling Rate	SPDIF Sampling Rate

PCM, SPDIF and DSD Pin Connections

PCM Audio Format

Notes:

XI clock (MCLK) must be > 192 x FSR when using PCM input (normal mode), or 128 x FSR (synchronous MCLK).
XI clock (MCLK) must be > 24 x FSR when using PCM input (OSF bypass mode).

Pin Name	Description
DATA1	Frame clock
DATA2	2-channel PCM serial data
DATA_CLK	Bit clock for PCM audio format

Master Mode (32-bit data only)

When Register #1 'input_select' is set to 2'd0 (I²S) and 'i2s_length' is set to 2'd2 (32-bit), the DAC can become a master for Bit Clock and Frame Clock by setting Register #9 'master clock enable' to 1'b1. The Bit Clock frequency can be configured to MCLK/4, MCLK/8 or MCLK/16 by setting Register #9 'clock divider select' to 2'b00, 2'b01 or 2'b10. GPIO 1 can be configured to output MCLK by setting Register #8 gpio1_cfg to 4'd3.

SPDIF Audio Format

Note: XI clock (MCLK) must be > 386 x FSR when using SPDIF input.

Up to 4 SPDIF inputs can be connected to the 4-to-1 mux, selectable via register "spdif_sel". SPDIF can also be sourced from a GPIO pin configured as input.

Pin Name	Description
GPIO1	SPDIF input 4
DATA1	SPDIF input 3
DATA2	SPDIF input 2
DATA_CLK	SPDIF input 1

DSD Audio Format

Note: XI clock (MCLK) must be > 3 x FSR when using DSD input.

Pin Name	Description
DATA[1:2]	2-channel DSD data input
DATA_CLK	Bit clock for DSD data input

FEATURE DESCRIPTION

Soft Mute

When Mute is asserted the output signal will ramp to the $-\infty$ level. When Mute is reset the attenuation level will ramp back up to the previous level set by the volume control register. Asserting Mute will not change the value of the volume control register. The ramp rate is $0.0078125 \times fs / 2^{(vol_rate-5)}$ dB/s.

Automute

During an automute condition the ramping of the volume of each DAC to $-\infty$ can now be programmatically enabled or disabled.

- In PCM serial mode, "AUTOMUTE" will become active once the audio data is continuously below the threshold set by <Register Automute_lev>, for a length of time defined by $2096896 / (<Register\#4> \times 64 \times fs)$ seconds.
- In SPDIF mode, "AUTOMUTE" will become active once the audio data is continuously below the threshold set by <Register Automute_lev>, for a length of time defined by $2096896 / (<Register\#4> \times (64 \times fs))$ seconds.
- In the DSD Mode, "AUTOMUTE" will become active when any 8 consecutive values in the DSD stream have as many 1's and 0's for a length of time defined by $2096896 / (<Register\ Automute_time> \times DATA_CLK)$ Seconds. The following table summarizes the conditions.

Mode	Detection Condition	Time
PCM	Data is continuously lower than <Register Automute_lev >	$2096896 / (<Register\ Automute_time > \times 64 \times fs)$
SPDIF	Data is continuously lower than <Register Automute_lev >	$2096896 / (<Register\ Automute_time > \times (64 \times fs))$
DSD	Equal number of 1s and 0s in every 8 bits of data	$2096896 / (<Register\ Automute_time > \times DATA_CLK)$

Volume Control

Each output channel has its own attenuation circuit. The attenuation for each channel is controlled independently. Each channel can be attenuated from 0dB to -127 dB in 0.5dB steps.

Each 0.5dB step transition takes up to 64 intermediate levels, depending on the vol_rate register setting. The result being that the level changes are done using small enough steps so that no switching noise occurs during the transition of the volume control. When a new volume level is set, the attenuation circuit will ramp softly to the new level.

Master Trim

The master trim sets the 0dB reference level for the volume control of each DAC. The master trim is programmable via registers 17-20 and is a 32bit signed number. Therefore it should never exceed $32'h7FFFFFFF$ (as this is full-scale signed).

All Mono Mode

An all mono mode where all DACs are driven from the same source is supported. This can be useful for high-end audio applications. The source data for all DACs can be programmatically configured to be either CH1 or CH2.

De-emphasis

The de-emphasis feature is included for audio data that has utilized the 50/15 μ s pre-emphasis for noise reduction. There are three de-emphasis filters, one for 32kHz, one for 44.1kHz, and one for 48kHz.

SPDIF Data Select

An SPDIF source multiplexer allows for up to three SPDIF sources to be connected to the data pins. An internal programmable register (spdif_sel) is used to select the appropriate data pin to decode. SPDIF can also be sourced from a GPIO pin configured as input.

ES9010K2M Datasheet

System Clock (XI / MCLK)

A system clock is required for proper operation of the digital filters and modulation circuitry. See p.28, Note 2 for the maximum MCLK frequencies supported. The minimum system clock frequency must also satisfy:

Data Type	Minimum MCLK Frequency	Note
DSD Data	$MCLK > 3 \times FSR$, $FSR = 2.8224\text{MHz}$ (x 1, 2 or 4)	The maximum FSR frequency is further limited by the maximum MCLK frequencies supported as shown p.28, Note 2.
Serial Normal Mode	$MCLK > 192 \times FSR$, $FSR \leq 384\text{kHz}$ or $MCLK = 128 \times FSR$ (synchronous MCLK) with $FSR \leq 384\text{kHz}$	
Serial OSF Bypass Mode	$MCLK > 24 \times FSR$, $FSR \leq 1.536\text{MHz}$	
SPDIF Data	$MCLK > 386 \times FSR$, $FSR \leq 200\text{kHz}$	

Data Clock

DATA_CLOCK must be $(2 \times i2s_length) \times FSR$ for SERIAL, and FSR for DSD modes. For SPDIF mode, this pin is used for SPDIF input. This pin should be pulled low if not used.

Built-in Digital Filters

Three digital filters (fast roll-off, slow roll-off and minimum phase filters) are included for PCM data. See 'PCM Filter Characteristics' for more information.

Standby Mode

For lowest power consumption the followings should be performed to enter stand-by mode:

- Set the soft_start bit in register 14 to 1'b0 to ramp the DAC outputs (DACL, DACLB, DACR, DACRB) to ground.
- RESETB pin should be brought to low digital level to:
 - Shut off the DACs, Oscillator and internal regulator.
 - Force digital I/O pins (DATA_CLK, DATA1, GPIO1, SDA) into tri-state mode
 - Reset all registers to default states
- If XI / MCLK is supplied externally, it should be stopped at logic low level
- If DVDD is supplied by an external regulator, it should be shutdown during standby

To resume from standby mode, bring RESETB to high digital level and reinitialize all registers.

DVDD Supply

The ES9010K2M is equipped with an internal regulated DVDD supply powered from VCCA. The internal DVDD regulator must be decoupled to DGND with a $4.7\mu\text{F}$ minimum capacitor for stable operation. Recommended capacitor for decoupling DVDD is a $4.7\mu\text{F} \pm 20\%$, X5R 6.3V 0402, e.g. TDK part number C1005X5R0J475M050BC or similar.

- The internal DVDD should be used except under the following conditions:
 1. PCM (SPDIF, I²S with OSF Bypass off or on): $MCLK > 50\text{MHz}$ or $FSR > 192\text{kHz}$
 2. DSD: $MCLK > 50\text{MHz}$ or $FSR > 11.2\text{MHz}$
- Internal DVDD may be used up to the maximum supported MCLK frequencies specified on p.28, Note 2. An External DVDD (+1.3V) supply must be used above those frequencies. The external supply voltage must be greater than the internal supply of +1.2V so the internal supply is disabled.

Programmable FIR filter

A two stage interpolating FIR design is used. The interpolating FIR filter is generated using MATLAB, and can then be downloaded using a custom C code.

Example Source Code for Loading a Filter

```
// only accept 128 or 16 coefficients
// Note: The coefficients must be quantized to 24 bits for this method!
// Note: Stage 1 consists of 128 values (0-127 being the coefficients)
// Note: Stage 2 consists of 16 values (0-13 being the coefficients, 14-15 are zeros)
// Note: Stage 2 is symmetric about coefficient 13. See the example filters for more information.
byte reg26 = (byte)(coeffs.Count == 128 ? 0 : 128);
for (int i = 0; i < coeffs.Count; i++)
{
    // stage 1 contains 128 coefficients, while stage 2 contains 16 coefficients
    registers.WriteRegister(26, (byte)(reg26 + i));

    // write the coefficient data
    registers.WriteRegister(27, (byte)(coeffs[i] & 0xff));
    registers.WriteRegister(28, (byte)((coeffs[i] >> 8) & 0xff));
    registers.WriteRegister(29, (byte)((coeffs[i] >> 16) & 0xff));

    registers.WriteRegister(30, 0x02); // set the write enable bit
}
// disable the write enable bit when we're done
registers.WriteRegister(30, (byte)(setEvenBit ? 0x04 : 0x00));
```

OSF Bypass

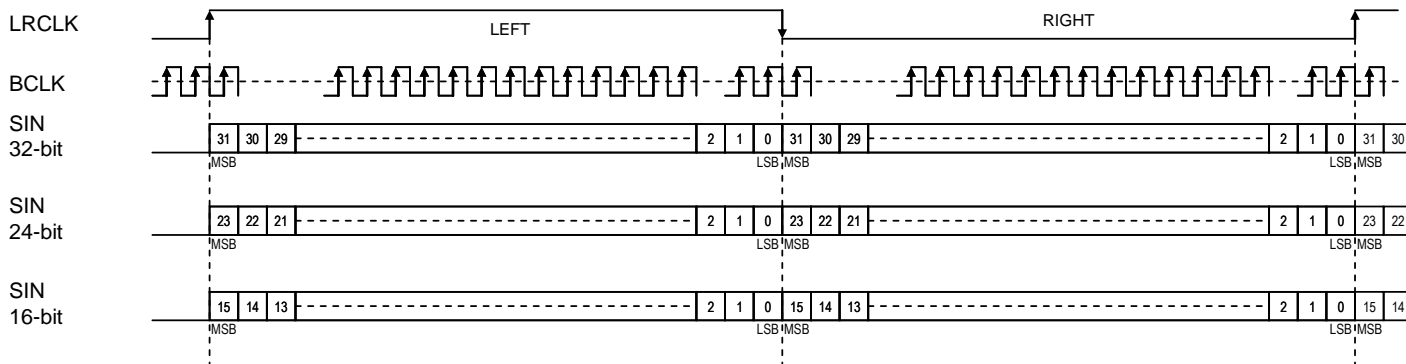

The oversampling FIR filter can be bypassed, sourcing data directly into the IIR filter. ESS recommends using 8 x FSR as the input. For example, an external signal at 44.1kHz can be oversampled externally to 8 x 44.1kHz = 352.8kHz and then applied to the serial decoder in either I²S or LJ format. The maximum sample rate that can be applied is 1.536MHz (8 x 192kHz).

ES9010K2M Datasheet

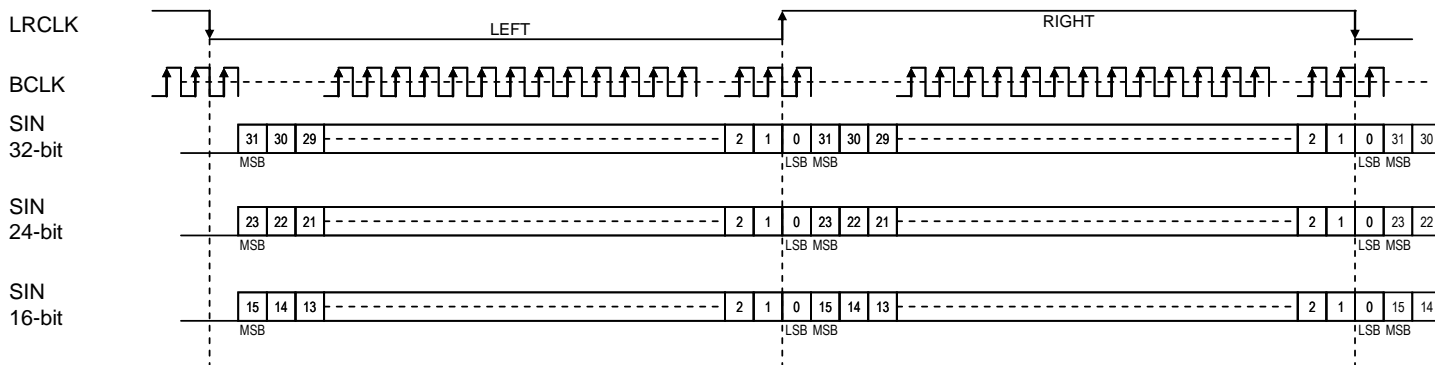

Audio Interface Formats

Several interface formats are provided so that direct connection to common audio processors is possible. The available formats and their accompanying diagrams are listed in the following table. The audio interface format can be set by programming the registers.

LEFT JUSTIFIED FORMAT

I2S FORMAT

Note: for Left-Justified and I²S formats, the following number of BCLKs is present per LRCLK frame (left plus right channels):

- 16-bit mode: 32 BCLKs
- 24-bit mode: 48 BCLKs
- 32-bit mode: 64 BCLKs

DSD NORMAL MODE

DSD PHASE MODE

SERIAL CONTROL INTERFACE

The registers inside the chip are programmed via an I²C interface. The diagram below shows the timing for this interface. The chip address can be set to 2 different settings via the “ADDR” pin. The table below summarizes this.

ADDR	CHIP ADDRESS
0	0x90
1	0x92

Notes:

1. The “ADDR” pin is used to create the CHIP ADDRESS. (0x90, 0x92)
2. The first byte after the chip address is the “ADDRESS” this is the register address.
3. The second byte after the CHIP ADDRESS is the “DATA” this is the data to be programmed into the register at the previous “ADDRESS”.

Parameter	Symbol	Standard-Mode		Fast-Mode		Unit
		MIN	MAX	MIN	MAX	
SCL Clock Frequency	f _{SCL}	0	100	0	400	kHz
START condition hold time	t _{HD,STA}	4.0	-	0.6	-	μs

[1:0]	mute	This is a soft mute, which uses the ramping volume control. mute[0] <ul style="list-style-type: none"> 1'b0: Channel 1 (default of left channel) unmuted (default) 1'b1: Channel 1 (default of left channel) muted mute[1] <ul style="list-style-type: none"> 1'b0: Channel 2 (default of right channel) unmuted (default) 1'b1: Channel 2 (default of right channel) muted

* All Reserved Bits in Register #7 must be set to the indicated logic level to ensure correct device operation.

ES9010K2M Datasheet

Register #8: GPIO Configuration

8 bit, Read-Write Register, Default = 0x10

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Mnemonic	reserved *				gpio1_cfg			
Default	0	0	0	1	0	0	0	0

Bit	Mnemonic	Description
[7:4]	reserved *	
[3:0]	gpio1_cfg	Set GPIO 1 configuration Default to 4'd0 (Automute Status). See GPIO Configuration Table below for meaning of all settings.

* All Reserved Bits in Register #8 must be set to the indicated logic level to ensure correct device operation.

GPIO Configuration Table

Setting	Direction	GPIO Function
4'd0	Output	Automute status (active high) – asserted when Automute condition is met
4'd1	Output	DPLL Lock status (active high) – asserted when DPLL is in lock
4'd2	Output	Minimum Volume (active high) - asserted when volume of both the left and right channels has ramped to its minimum value (–127.5dB).
4'd3	Output	MCLK
4'd4	Output	DPLL Lock interrupt (active high) - asserted when DPLL Lock status changes state - reading register 64 clears the interrupt
4'd5	Output	Automute Interrupt (active high) - asserted when Automute status changes state - reading register 64 clears the interrupt
4'd6	Output	DPLL Lock or Automute interrupt (active high) - asserted when DPLL Lock or Automute status changes state - reading register 64 clears the interrupt
4'd7	Output	Output low
4'd8	Input	Use as input pin - pin status can be read from register 65.
4'd9	Input	Input Selection - uses the GPIO as an input select based on register 21
4'd15	Output	Output high

Register #9: Reserved

8 bit, Read-Write Register, Default = 0x22

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Mnemonic	Reserved for Revision V							
Default	0	0	0	0	0	0	0	0

Register #10: Master Mode Control

8 bit, Read-Write Register, Default = 0x5

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Mnemonic	master_clock_enable	clock_divider_select	sync_mode	stop_div				
Default	0	0	0	0	0	1	0	1

Bit	Mnemonic	Description
[7]	master_clock_enable	1'b0 disables master mode (default) 1'b1 enables master mode (driving Bit clock and Frame Clock)
[6:5]	clock_divider_select	2'b00: Bit Clock frequency = MCLK / 4 (default) 2'b01: Bit Clock frequency = MCLK / 8 2'b10: Bit Clock frequency = MCLK / 16 2'b11: Bit Clock frequency = MCLK / 16 Frame Clock frequency = Bit Clock frequency / 64
[4]	sync_mode	1'b0 for normal operation of the DPLL and ASRC. 1'b1 to enable quick lock if the fs and MCLK are synchronous and MCLK is 128 x FSR. Note: quick lock can only be used in PCM normal mode.
[3:0]	stop_div	Sets the number of FSR edges that must occur before the DPLL and ASRC can lock on to the incoming signal. 4'd0 = 16384 FSR edges 4'd1 = 8192 FSR edges 4'd2 = 5461 FSR edges 4'd3 = 4096 FSR edges 4'd4 = 3276 FSR edges 4'd5 = 2730 FSR edges (default) 4'd6 = 2340 FSR edges 4'd7 = 2048 FSR edges 4'd8 = 1820 FSR edges 4'd9 = 1638 FSR edges 4'd10 = 1489 FSR edges 4'd11 = 1365 FSR edges 4'd12 = 1260 FSR edges 4'd13 = 1170 FSR edges 4'd14 = 1092 FSR edges 4'd15 = 1024 FSR edges

For correct operation, master mode should only be enabled when the DAC's input mode is set to I²S, and when i2s_length is set to 32-bit and i2s_mode is set to I²S in register 1.

When master mode is enabled, the DATA_CLK pin will output Bit Clock and the DATA1 pin will output Frame Clock at frequencies specified by clock divider select.

For compatibility with Rev. W, or when PCM data with FSR > 96kHz is used, stop_div should be set to 4'd0 (16384 FSR edges).

ES9010K2M Datasheet

Register #11: Channel Mapping

8 bit, Read-Write Register, Default = 0x02

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Mnemonic	reserved *	spdif_sel			ch2_analog_swap	ch1_analog_swap	ch2_sel	ch1_sel
Default	0	0	0	0	0	0	1	0

Bit	Mnemonic	Description
[7]	reserved *	
[6:4]	spdif_sel	select the spdif data source 3'd0 = DATA_CLK (default) 3'd1 = DATA2 3'd2 = DATA1 3'd3 = GPIO1 3'd4-7: reserved
[3]	ch2_analog_swap	1'b0 = normal operation (default) 1'b1 = swap dac and dacb
[2]	ch1_analog_swap	1'b0 = normal operation (default) 1'b1 = swap dac and dacb
[1]	ch2_sel	1'b0 = left 1'b1 = right (default)
[0]	ch1_sel	1'b0 = left (default) 1'b1 = right

* All Reserved Bits in Register 11 must be set to the indicated logic level to ensure correct device operation.

Left and Right channels can be reversed using Register #11.

Register #12: DPLL/ASRC Settings

8 bit, Read-Write Register, Default = 0x5A

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Mnemonic	dpll_bw_i2s				dpll_bw_dsd			
Default	0	1	0	1	1	0	1	0

Bit	Mnemonic	Description
[7:4]	dpll_bw_i2s	DPLL bandwidth setting for I ² S and SPDIF modes (16 settings) 4'b0000 : OFF 4'b0001 : Lowest Bandwidth 4'b0101 : (default) 4'b1010 : 4'b1111 : Highest Bandwidth
[3:0]	dpll_bw_dsd	DPLL bandwidth setting for DSD mode (16 settings) 4'b0000 : OFF 4'b0001 : Lowest Bandwidth 4'b0101 : 4'b1010 : (default) 4'b1111 : Highest Bandwidth

Register #13: THD Compensation

8 bit, Read-Write Register, Default = 0x40

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Mnemonic	reserved *	bypass_thd	reserved *					
Default	0	1	0	0	0	0	0	0

Bit	Mnemonic	Description
[7]	reserved *	
[6]	bypass_thd	1'b1: disable THD compensation (default) <ul style="list-style-type: none"> PCM mode: output = input; DSD mode: output = input / 2 1'b0: enable THD compensation <ul style="list-style-type: none"> output = input + (input²) x thd_comp_c2 + (input³) x thd_comp_c3 thd_comp_c2 is stored in registers 23-22 (16 bits signed) (register 23 stores MSBs) thd_comp_c3 is stored in registers 25-24 (16 bits signed) (register 25 stores MSBs)
[5:0]	reserved	

* All Reserved Bits in Register #13 must be set to the indicated logic level to ensure correct device operation.

THD compensation can be used to reduce the 2nd and 3rd harmonic distortion introduced by external output drivers. A system level tuning is required to arrive at the optimum coefficients for thd_comp_c2 and thd_comp_c3.

Notes:

- To get the same gain (output = input) for PCM and DSD modes without THD compensation, bypass_thd should be set to 1'b0 with thd_comp_c2 and thd_comp_c3 set to 16'd0 (default)
- Erroneous compensation can lead to higher distortion than the one without compensation. If accurate tuning cannot be performed, thd_comp_c2 and thd_comp_c3 should be set to 16'd0 (default) if bypass_thd is set to 1'b0.

ES9010K2M Datasheet

Register #14: Soft Start Settings

8 bit, Read-Write Register, Default = 0x8A

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Mnemonic	soft_start	soft_start_on_lock	mute_on_lock	soft_start_time				
Default	1	0	0	0	1	0	1	0

Bit	Mnemonic	Description
[7]	soft_start	1'b0: Ramp the output stream to ground 1'b1: Normal operation (default) - ramp the output stream to ½ x AVCC_L/R
[6]	soft_start_on_lock	1'b1: Force output low when lock is lost 1'b0: Do not force output low when lock is lost (default)
[5]	mute_on_lock	1'b1: Force a mute when lock is lost 1'b0: Do not force a mute when lock is lost (default)
[4:0]	soft_start_time	Time for soft start ramp = $4096 \times 2^{(\text{soft_start_time}+1)} / \text{MCLK}$ seconds (where MCLK is measured in Hz). The valid range of soft_start_time is from 0 to 20.

Register #15: Volume 1 (usually selected for the Left Channel, but can be reversed using Register #11)

8 bit, Read-Write Register, Default = 0x00

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Mnemonic	volume1							
Default	0	0	0	0	0	0	0	0

Bit	Mnemonic	Description
[7:0]	volume1	Default to 8'd0 0dB to -127.5dB in 0.5dB steps

Register #16: Volume 2 (usually selected for the Right Channel, but can be reversed using Register #11)

8 bit, Read-Write Register, Default = 0x00

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Mnemonic	volume2							
Default	0	0	0	0	0	0	0	0

Bit	Mnemonic	Description
[7:0]	volume2	Default to 8'd0 0dB to -127.5dB in 0.5dB steps

Register #20-17: Master Trim

32 bit, Read-Write Register, Default=32'h7ffffff. Reg 20 are the MSB's, Reg 17 are the LSB's.

Bits	[31:0]
Mnemonic	master_trim
Default	32'h7ffffff

This is a 32 bit value that sets the 0dB level for all volume controls. This is a signed number, so it should never exceed 32'h7ffffff (which is $2^{31} - 1$).

Register #21: GPIO Input Selection and OSF Bypass

8 bit, Read-Write Register, Default = 0x00

Bits	[7:6]	[5:4]	[3]	[2]	[1]	[0]	
Mnemonic	gpio_input_sel2		gpio_input_sel1	reserved *	bypass_iir	reserved *	bypass_osf
Default	0	0	0	0	0	0	0

Bit	Mnemonic	Description
[7:6]	gpio_input_sel2	Selects which input will be selected when GPIOX = 1'b1 2'd0 = I ² S data (default) 2'd1 = SPDIF data 2'd2 = reserved 2'd3 = DSD data
[5:4]	gpio_input_sel1	Selects which input will be selected when GPIOX = 1'b0 2'd0 = I ² S data (default) 2'd1 = SPDIF data 2'd2 = reserved 2'd3 = DSD data
[3]	reserved *	
[2]	bypass_iir	1'b0 = Use the IIR filter (default) 1'b1 = Bypass the IIR filter.
[1]	reserved	
[0]	bypass_osf	1'b0 = Use the interpolating 8x FIR filter (default) 1'b1 = Bypass the interpolating 8x FIR filter. Note: Bypassing the interpolating filter requires that the input data be oversampled at 8x fs by an external oversampling filter.

* All Reserved Bits in Register #21 must be set to the indicated logic level to ensure correct device operation.

Note: Any of the GPIO can be configured to be used as an input select. This allows an external MCU or controller to set the input type by setting the GPIO to either logic high (1'b1) or logic low (1'b0). To set this feature, the first step is to enable one of the GPIO as an input select by setting gpio_cfg to 4'd9. Once a GPIO is configured as an input select it has the ability to select between two different inputs. The first input (logic low) is set via register 21[5:4]. The second input (logic high) is set via register 21[7:6].

Register #23-22: 2nd Harmonic Compensation Coefficients

16 bit, Read-Write Register, Default = 0x0000 (no compensation). Register #23 is MSB. See Register #13 for more details.

Bits	[15:0]
Mnemonic	Thd_comp_c2
Default	16'd0

Register #25-24: 3rd Harmonic Compensation Coefficients

16 bit, Read-Write Register, Default = 0x0000 (no compensation). Register #25 is MSB. See Register #13 for more details.

Bits	[15:0]
Mnemonic	Thd_comp_c3
Default	16'd0

ES9010K2M Datasheet

Register #26: Programmable Filter Address

8 bit, Read-Write Register, Default = 0x00

Bits	[7]	[6:0]
Mnemonic	prog_coeff_stage	prog_coeff_addr
Default	0	0 0 0 0 0 0 0

Bit	Mnemonic	Description
[7]	prog_coeff_stage	Selects which stage of the filter to write. 1'b1 = Stage 2 of the oversampling filter (16 coefficients). 1'b0 = Stage 1 of the oversampling filter (128 coefficients).
[6:0]	prog_coeff_addr	Selects the coefficient address when writing custom coefficients for the oversampling filter.

Register #29-27: Programmable Filter Coefficient

8 bit, Read-Write Register, Default = 0x000000

Bits	[23:0]
Mnemonic	prog_coeff
Default	24'd0

Bit	Mnemonic	Description
[23:0]	prog_coeff	A 24-bit filter coefficient that will be written to address 'prog_coeff_addr'.

Register #30: Programmable Filter Control

8 bit, Read-Write Register, Default = 0x00

Bits	[7:3]	[2]	[1]	[0]
Mnemonic	reserved *	even_stage2_coeff	prog_coeff_we	prog_coeff_en
Default	0 0 0 0 0	0	0	0

Bit	Mnemonic	Description
[7:3]	reserved *	
[2]	even_stage2_coeff	Sets the type of symmetry of the stage 2 programmable filter. 1'b0 = Uses a sine symmetric filter (27 coefficients). 1'b1 = Uses a cosine symmetric filter (28 coefficients).
[1]	prog_coeff_we	1'b0 = Disable writing to the custom filter coefficients. 1'b1 = Enable writing to the custom filter coefficients. Note: When set to 1'b1 the custom filter will be bypassed regardless of the state of register 21[0].
[0]	prog_coeff_en	1'b0 = Use one of the built-in oversampling filters. 1'b1 = Use the custom oversampling filter. Note: The custom filter is not programmed to anything on reset, valid coefficients must be written to the filter before enabling.

* All Reserved Bits in Register #30 must be set to the indicated logic level to ensure correct device operation.

Note: even_stage2_coeff sets the type of symmetry used by the second stage filter. The actual RAM is 16 coefficients, but only the first 14 coefficients are used when applying the oversampling filter. The first 14 coefficients are mirrored using either sine or cosine symmetry, resulting in a filter length of either 27 or 28 taps. This means that the second stage RAM should only contain half of the impulse response of the second stage filter, and the impulse peak value will be contained in the 14th coefficient. Also note that, due to the symmetry of the filter, only linear phase filters may be used in the second stage.

Register #64: Chip Status

8 bit, Read-Only Register

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Mnemonic	reserved		revision	chip_id			automute_status	lock_status

Bit	Mnemonic	Description
[7:6]	reserved	
[5]	revision	1'b0 => revision W. 1'b1 => revision V.
[4:2]	chip_id	3'd7 => ES9010K2M
[1]	automute_status	1'b0 => Automute condition is inactive. 1'b1 => Automute condition is active.
[0]	lock_status	1'b0 => The Jitter Eliminator is not locked to an incoming signal. 1'b1 => The Jitter Eliminator is locked to an incoming signal.

Register #65

8 bit, Read-Only Register

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Mnemonic	reserved							gpio_l[1:0]

Bit	Mnemonic	Description
[7:2]	reserved *	
[0]	gpio_l[0]	Status of pin GPIO1

Register #69-66: DPLL Ratio

32 bit, Read-Only Register. Reg 69 are the MSB's, Reg 66 are the LSBs

Bits	[31:0]
Mnemonic	dppll_num

This is a read-only 32-bit value that can be used to calculate the sample rate. The raw sample rate (FSR) can be calculated using: $FSR = (DPLL_NUM \times F_{MCLK}) / 2^{32}$.

Note that the DPLL number (register 66-69) should be read from LSB to MSB as it is latched on the LSBs (register 66).

Register #93-70: Channel Status

Register 93 contains the MSBs, Register 70 contains the LSBs Format is [191:0]

These registers allow read back of the SPDIF channel status. The status definition is different for the consumer configuration and professional configuration. Please refer to the following two tables for details.

ES9010K2M Datasheet

APPLICATION DIAGRAM

RECOMMENDED POWER-UP SEQUENCE

ABSOLUTE MAXIMUM RATINGS

PARAMETER	RATING
Storage temperature	-65°C to +150°C
Operating Junction Temperature	+125°C
Voltage range for digital input pins	-0.3V to VCCA+ 0.3V
ESD Protection	
Human Body Model (HBM)	2000V
Machine Model (MM)	200V

WARNING: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

WARNING: Electrostatic Discharge (ESD) can damage this device. Proper procedures must be followed to avoid ESD when handling this device.

RECOMMENDED OPERATING CONDITIONS

PARAMETER	SYMBOL	CONDITIONS
Operating temperature	T _A	-20°C to +70°C

Power Supply		Voltage	Current nominal (Note 1)	Current standby (Notes 1, 2)
Analog Core Supply Voltage	VCCA	+1.8V ± 5% +3.3V ± 5%	13.7mA 16.5mA	0mA 0mA
Internal Analog Power Supply	VREG	+1.2V (typical)		
Internal Digital Core Supply	DVDD	+1.2V (typical)		
External Digital Core Supply	DVDD	+1.3V ± 5% (Note 3)	50mA	0mA
Analog Power Supply Voltage	AVCC_L AVCC_R	+3.3V ± 5%	8.0mA	0mA
Total Power		VCCA = +1.8V VCCA = +3.3V	25mW 55mW	< 1mW < 1mW

Notes:

- (1) f_s = 44.1kHz, external MCLK = 22MHz, I²S input, DAC output connected to current-to-voltage converter, internal DVDD, all external supply voltages at nominal center values
- (2) With RESETB held low after setting the soft_start bit in register 14 to 1'b0 to fully ramp the DAC outputs to ground
- (3) Internal DVDD should be used except under the conditions described on page 7. The external DVDD supply voltage must be greater than the internal +1.2V supply so the internal regulator is disabled. External DVDD current measured at 192kHz sample rate and MCLK = 80MHz.

DC ELECTRICAL CHARACTERISTICS

Symbol	Parameter	Minimum	Maximum	Unit	Comments
V _{IH}	High-level input voltage	VCCA/2 + 0.4		V	
V _{IL}	Low-level input voltage		0.4	V	
V _{OH}	High-level output voltage	VCCA-0.2		V	IOH = 100uA
V _{OL}	Low-level output voltage		0.2	V	IOL = 100uA.

ES9010K2M Datasheet

XI / MCLK Timing

Parameter	Symbol	Min	Max	Unit
MCLK pulse width high	T_{MCH}	4.5		ns
MCLK pulse width low	T_{MCL}	4.5		ns
MCLK cycle time	T_{MCY}	10		ns
MCLK duty cycle		45:55	55:45	

Audio Interface Timing

Parameter	Symbol	Min	Max	Unit
DATA_CLK pulse width high	t_{DCH}	4.5		ns
DATA_CLK pulse width low	t_{DCL}	4.5		ns
DATA_CLK cycle time	t_{DCY}	10		ns
DATA_CLK duty cycle		45:55	55:45	
DATA set-up time to DATA_CLK rising edge	t_{DS}	4.1		ns
DATA hold time to DATA_CLK rising edge	t_{DH}	2		ns

- Notes:**
- Audio data on DATA[2:1] are sampled at the rising edges of DATA_CLK and must satisfy the setup and hold time requirements relative to the rising edge of DATA_CLK
 - For DSD Phase mode, the normal data (D0, D1, D2 .. on p.10) must satisfy the setup and hold time requirements relative to the rising edge of DATA_CLK. The complimentary data (D0, D1, etc.) will be ignored.

ANALOG PERFORMANCE

Test Conditions (unless otherwise tated)

1. $T_A=25^{\circ}\text{C}$, $V_{CCA}=3.3\text{V}$, internal DVDD with $4.7\mu\text{F} \pm 20\%$ decoupling, $f_s = 44.1\text{kHz}$, $\text{MCLK} = 27\text{MHz}$ & 32-bit data
2. SNR/DNR: A-weighted over 20Hz-20kHz in averaging mode
3. THD+N: un-weighted over 20Hz-20kHz bandwidth

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNIT
Resolution			32		Bits
MCLK (PCM normal mode)	Note *3	192FSR		Note *2	Hz
MCLK (PCM OSF bypass mode)		24FSR			
MCLK (DSD mode)		3FSR			
MCLK (SPDIF mode)		386FSR			
DYNAMIC PERFORMANCE					
DNR (differential current mode)	-60dBFS		116		dB-A
THD+N (differential current mode)	0dBFS		-106		dB
ANALOG OUTPUT					
Differential (+ or -) voltage out range	Full-scale out		1.11		Vp-p
Differential (+ or -) voltage out offset	Bipolar zero out		0.6		V
Differential (+ or -) current out range (Note *1)	Full-scale out		1.377		mA p-p
Differential (+ or -) current out offset (Note *1)	Bipolar zero out to virtual ground at voltage V_g (V)		$0.77 - (1000 \times V_g) / 806$		mA
Digital Filter Performance					
De-emphasis error				± 0.2	dB
Mute Attenuation			127		dB
PCM Filter Characteristics (Sharp Roll Off)					
Pass band	$\pm 0.003\text{dB}$			$0.454f_s$	Hz
	-3dB			$0.49f_s$	Hz
Stop band	$< -115\text{dB}$	$0.546f_s$			Hz
Group Delay			$35 / f_s$		s
PCM Filter Characteristics (Slow Roll Off)					
Pass band	$\pm 0.05\text{dB}$			$0.308f_s$	Hz
	-3dB			$0.454f_s$	Hz
Stop band	$< -100\text{dB}$	$0.814f_s$			Hz
Group Delay			$6.25 / f_s$		s
PCM Filter Characteristics (Minimum Phase) – revision V only					
Pass band	$\pm 0.003\text{dB}$			$0.454f_s$	Hz
	-3dB			$0.49f_s$	Hz
Stop band	$< -115\text{dB}$	$0.546f_s$			Hz

Notes:

- *1. Differential (+ or -) current output is equivalent to a differential (+ or -) voltage source in series with an $806\Omega \pm 11\%$ resistor. The differential (+ or -) voltage source has a peak-to-peak output range of 1.11V & an output offset of 0.6V.
- *2. With internal DVDD, maximum MCLK frequency is 50MHz (DVCC = 1.8V), or 100MHz (DVCC = 3.3V) with an external +1.3V DVDD supply.
- *3. Synchronous MCLK at $128 \times \text{FSR}$ is also supported.

28-Pin QFN Mechanical Dimensions

NOTES :

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSION *b* APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.15mm AND 0.30mm FROM THE TERMINAL TIP. IF THE TERMINAL HAS THE OPTIONAL RADIUS ON THE OTHER END OF THE TERMINAL, THE DIMENSION *b* SHOULD NOT BE MEASURED IN THAT RADIUS AREA.
3. BILATERAL COPLANARITY ZONE APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.

SYMBOLS	MIN.	NOM.	MAX.
A	0.70		0.90
A1	0.00	0.02	0.05
A3	0.203 REF.		
<i>b</i>	0.18	0.25	0.30
D	5.00 BSC		
E	5.00 BSC		
<i>e</i>	0.50 BSC		
K	0.20	—	—

PAD SIZE	E2			D2			L			LEAD FINISH	
	MIN.	NOM.	MAX.	MIN.	NOM.	MAX.	MIN.	NOM.	MAX.	Pure Tin	PPF
	2.50		3.60	2.50		3.60	0.50	0.55	0.60	V	X

Example 28-Pin QFN Land Pattern

Non Solder Mask Defined Pad
All Around

Notes:

1. All dimensions are in millimeters.
2. Thermal vias should be 0.3mm to 0.33mm in diameter, with the barrel plated to 1oz copper.
3. For maximum solder mask in the corners, round the inner corners of each row.
4. Exposed pad should be solder mask defined.
5. Pad width can be reduced to 0.25mm if additional pad to pad clearance is required.
6. For applications where solder loss through vias is a concern, plugging or tenting of the vias should be used. The solder mask diameter for each via should be 0.1mm larger than the via diameter.

ES9010K2M Datasheet

Reflow Process Considerations

For lead-free soldering, the characterization and optimization of the reflow process is the most important factor you need to consider.

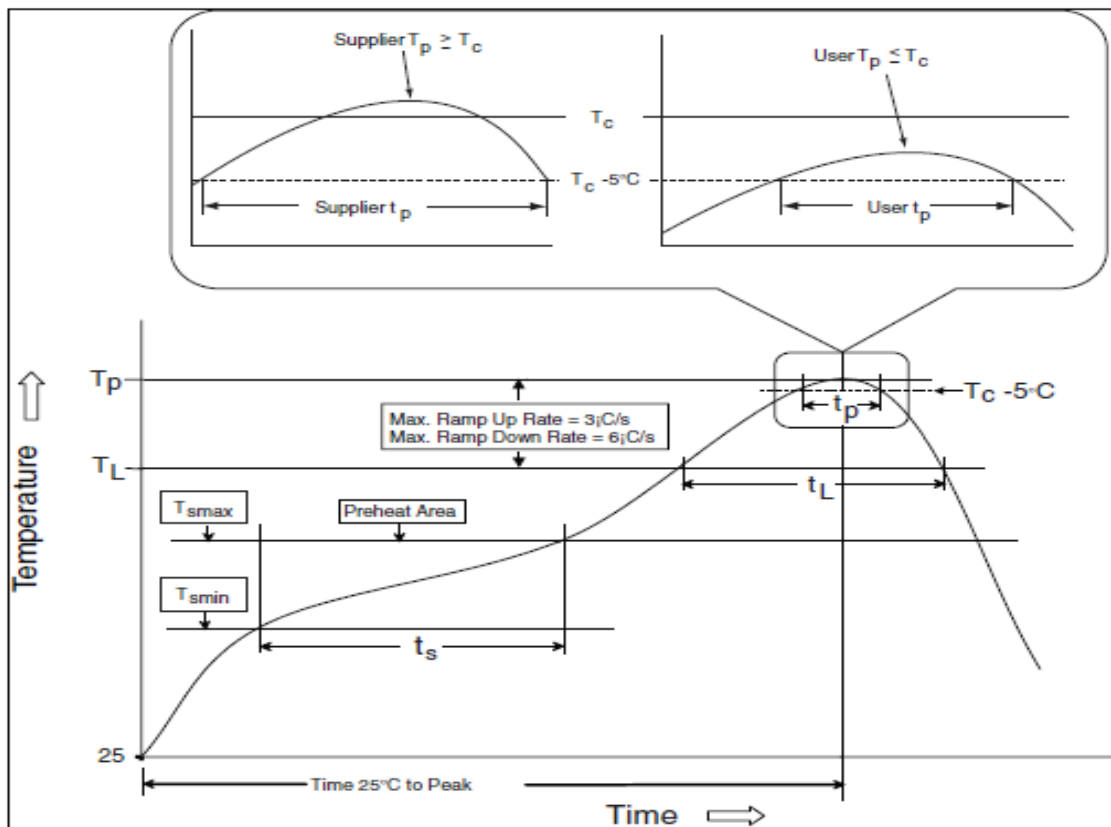

The lead-free alloy solder has a melting point of 217°C. This alloy requires a minimum reflow temperature of 235°C to ensure good wetting. The maximum reflow temperature is in the 245°C to 260°C range, depending on the package size (*Table RPC-2*). This narrows the process window for lead-free soldering to 10°C to 20°C.

The increase in peak reflow temperature in combination with the narrow process window makes the development of an optimal reflow profile a critical factor for ensuring a successful lead-free assembly process. The major factors contributing to the development of an optimal thermal profile are the size and weight of the assembly, the density of the components, the mix of large and small components, and the paste chemistry being used.

Reflow profiling needs to be performed by attaching calibrated thermocouples well adhered to the device as well as other critical locations on the board to ensure that all components are heated to temperatures above the minimum reflow temperatures and that smaller components do not exceed the maximum temperature limits (*Table RPC-2*).

To ensure that all packages can be successfully and reliably assembled, the reflow profiles studied and recommended by ESS are based on the JEDEC/IPC standard J-STD-020 revision D.1.

Figure RPC-1. IR/Convection Reflow Profile (IPC/JEDEC J-STD-020D.1)

Note: Reflow is allowed 3 times. Caution must be taken to ensure time between re-flow runs does not exceed the allowed time by the moisture sensitivity label. If the time elapsed between the re-flows exceeds the moisture sensitivity time bake the board according to the moisture sensitivity label instructions.

Manual Soldering:

Allowed up to 2 times with maximum temperature of 350 degrees no longer than 3 seconds.

Table RPC-1 Classification reflow profile

Profile Feature	Pb-Free Assembly
Preheat/Soak	
Temperature Min (T _{min})	150°C
Temperature Max (T _{max})	200°C
Time (ts) from (T _{min} to T _{max})	60-120 seconds
Ramp-up rate (TL to T _p)	3°C / second max.
Liquidous temperature (TL)	217°C
Time (tL) maintained above TL	60-150 seconds
Peak package body temperature (T _p)	For users T _p must not exceed the classification temp in Table RPC-2. For suppliers T _p must equal or exceed the Classification temp in Table RPC-2.
Time (t _p)* within 5°C of the specified classification temperature (T _c), see Figure RPC-1	30* seconds
Ramp-down rate (T _p to TL)	6°C / second max.
Time 25°C to peak temperature	8 minutes max.
* Tolerance for peak profile temperature (T _p) is defined as a supplier minimum and a user maximum.	

Note 1: All temperatures refer to the center of the package, measured on the package body surface that is facing up during assembly reflow (e.g., live-bug). If parts are reflowed in other than the normal live-bug assembly reflow orientation (i.e., dead-bug), T_p **shall** be within ± 2°C of the live-bug T_p and still meet the T_c requirements, otherwise, the profile **shall** be adjusted to achieve the latter. To accurately measure actual peak package body temperatures refer to JEP140 for recommended thermocouple use.

Note 2: Reflow profiles in this document are for classification/preconditioning and are not meant to specify board assembly profiles. Actual board assembly profiles should be developed based on specific process needs and board designs and should not exceed the parameters in Table RPC-1.

For example, if T_c is 260°C and time t_p is 30 seconds, this means the following for the supplier and the user.

For a supplier: The peak temperature must be at least 260°C. The time above 250°C must be at least 30 seconds.

For a user: The peak temperature must not exceed 260°C. The time above 255°C must not exceed 30 seconds.

Note 3: All components in the test load **shall** meet the classification profile requirements.

Table RPC-2 Pb-Free Process – Classification Temperatures (T_c)

Package Thickness	Volume mm ³ , <350	Volume mm ³ , 350 to 2000	Volume mm ³ , >2000
<1.6 mm	260°C	260°C	260°C
1.6 mm – 2.5 mm	260°C	250°C	245°C
>2.5 mm	250°C	245°C	245°C

Note 1: At the discretion of the device manufacturer, but not the board assembler/user, the maximum peak package body temperature (T_p) can exceed the values specified in Table RPC-2. The use of a higher T_p does not change the classification temperature (T_c).

Note 2: Package volume excludes external terminals (e.g., balls, bumps, lands, leads) and/or non-integral heat sinks.

Note 3: The maximum component temperature reached during reflow depends on package thickness and volume. The use of convection reflow processes reduces the thermal gradients between packages. However, thermal gradients due to differences in thermal mass of SMD packages may still exist.

ES9010K2M Datasheet

ORDERING INFORMATION

Part Number	Description	Package
ES9010K2M	Sabre ³² ® Premier 32-bit Low Power Stereo Audio DAC	28-pin QFN

The letter K identifies the package type QFN.

Revision History

Rev.	Date	Notes
1.0	March 5, 2014	Update features from Rev. V silicon
1.1	March 19, 2014	Update MCLK requirement
1.2	April 15, 2014	Update sync_mode requirement
1.3	May 28, 2014	Update DSD L/R pin assignment. Add THD compensation registers. Update mechanical drawing and add land pattern. Update migration notes
1.4	July 28, 2014	Updated ESS' FAX number. Added medical usage disclaimer
1.5	August 28, 2014	Added conditions when an external DVDD regulator is required
1.6	September 8, 2014	Corrected typo on Register#7 Bit [6:5], 3'dX changed to 2'dX. Identified Left and Right channels for Registers #15 and #16 respectively. Updated DAC output impedance from 781.25Ω to 806Ω
1.7	September 24, 2014	Removed reference to Right Justified data format that is not supported
1.8	October 10, 2014	Added information on the use of an external +1.3V DVDD supply
1.9	October 16, 2014	Added table to Register #65 description
2.0	January 8, 2015	Added details on decoupling required for the DVDD core supply. Deleted old revision history from 0.1 to 0.91.
2.1	April 8, 2015	Added notes on the connection of reserved Bits in the device control registers. Updated ESS' address and phone number. Added SABRE HiFi Logo
2.2	June 10, 2015	Added typical value of AVCC_L plus AVCC_R = 8mA
2.3	December 2, 2016	Corrected Recommended Operating Conditions table formatting.
2.4	January 24, 2017	Corrected THD compensation description and Recommended Operating Conditions table formatting.
2.5	January 31, 2017	Remove references to Revision W silicon, clarify I2C address description.
2.6	February 14, 2017	Added description for Registers #2, #3 and #9. Register #65 labeled as GPIO Status. Added register map. Adjusted page number references as needed.
2.7	November 28, 2017	Remove ESS logo from pin diagram
2.8	November 14, 2018	Added Low Power Audio DAC description, removed Advanced Information
2.9	March 13, 2019	Removed ESR capacitor requirement for DVDD. Updated registered trademark for SABRE® and Sabre ³² ®
3.0	January 7, 2021	Updated I/V converter filter circuit
3.1	March 25, 2021	Update Register #9 default setting
3.2	April 1, 2021	Corrected "μs" to "ns" in the SDA setup time parameter.
3.3	April 27, 2021	Updated analog performance table.
