

The ESS Sabre® ES9027PRO is a 32-bit 8 Channel digital-to-analog converters (DAC) that target high end consumer devices, professional audio applications such as recording systems, mixer consoles and digital audio workstations (DAW), test equipment, instruments, audio processors applications. It was designed to create the new generation of the world’s highest performing audio DAC series.

The ES9027PRO has 8 integrated DACs which use ESS’ patented Hyperstream® IV DAC Architecture. Using the Dual modulator architecture, it delivers incredible audio sound quality and specifications, including +124dB DNR, -114dB THD+N per channel.

The ES9027PRO SABRE® DAC improves on previous designs to include:

- TDM & SPI support for more options in connectivity
- Lower power consumption than previous generations, including the Hyperstream IV DAC modulator
- New Hardware mode for simplified programming.

TDM, DSD, DoP, and I2S, LJ, master/slave interfaces as well as synchronous S/PDIF are supported.

The ES9027PRO has 7 built-in pre-programmed digital filters which allows the most discerning user to tune the SABRE sound to their own personal sound signature.

FEATURE	DESCRIPTION
Patented 32-bit HyperStream® IV Architecture DAC Technology	32-bit audio DAC with high dynamic range & ultra-low distortion
+124dB DNR per channel -114dB THD+N per channel	Unprecedented dynamic range and ultra-low distortion
High Sample Rates	Up to PCM 768kHz & native DSD1024
Customizable filter characteristics	7 predefined digital filters optimized for latency or sound color for each channel to allow for a unique sound signature
Multiple Input formats are available	I2S, LJ, RJ, TDM, DSD, DoP and S/PDIF
I2C, SPI, and Hardware interface control	Configured by microcontroller or other I2C/SPI source, or pins through Hardware Mode
Lower Power Consumption than Previous Gen.	Simplifies power supply design
Standardized Packaging	7mm x 7mm, 48 pin QFP/QFN for reduced PCB board space

APPLICATIONS

- Professional digital audio workstations (DAW) Audio Playback
- AV Receivers
- Personal Audio Devices & Media Streamers
- High End Audiophile Equipment
- Any equipment that requires the very best audio digital to analog conversion

Feature List

The ES9027PRO is a SABRE 8 channel high performance digital to analog converter (DAC) with features and performance including the new Hyperstream IV modulator that produces a device that is well suited for all Audiophile and PRO Audio applications.

These features include TDM & SPI support as well as a Hardware (HW) mode for simplifying configuration of the ES9027PRO.

TDM / I2S / LJ / RJ / DSD / DoP & S/PDIF interfaces are supported.

Sample rates up to 768kHz with PCM data and DSD rates up to DSD1024 are supported. 7 selectable build-in digital filters are also available.

Configuration Modes

The ES9027PRO has 4 control programming modes. They are controlled by the state of the MODE (pin 17):

MODE PIN	Configuration
0	I ² C interface
Pull Low	HW control mode (see Hardware Mode Table)
Pull High	HW control mode (see Hardware Mode Table)
1	SPI interface

Software Mode

ES9027PRO supports both I²C or SPI serial communication to configure the registers. There are two types of registers, read/write registers and read-only registers.

See below for the pin connection for each one:

I²C

- MODE (Pin 17) – **GND**
- Connect per I²C standard
 - SDA (Pin 15)
 - SCL (Pin 16)
 - ADDR0 (Pin 31)
 - ADDR1 (Pin 30)

I ² C Address	ADDR1	ADDR0
0x90	GND	GND
0x92	GND	AVDD
0x94	AVDD	GND

SPI

- Mode (Pin 17) – **AVDD**
- Connect per SPI standard
 - MOSI (Pin 15)
 - SCLK (Pin 16)
 - SS (Pin 30)
 - MISO (Pin 31)

Hardware Mode

The ES9027PRO has 32 pre-configured modes that can be set with external pin configuration. These modes configure the DAC for different input serial data rates and set the DAC muting.

These modes are set with pins:

- MODE (Pin 17)
- HW0 (Pin 15)
- HW1 (Pin 16)
- HW2 (Pin 30)
- MUTE_CTRL (Pin 31)

Each hardware mode pin has 4 states:

- 0 – Pin directly connected to GND
- 1 – Pin directly connected to AVDD
- Pull 0 – Pin pulled to GND through 47kΩ resistor
- Pull 1 – Pin pulled to AVDD through 47kΩ resistor

Design Information

Each hardware mode pin can be configured with either a pull-up or pull-down resistor. Therefore, it is important that the pin is configured to allow for the desired hardware modes. Some guidelines include the following:

- The HW0 and HW1 pins never require a pull up or pull-down resistor.

Figure 2 – Hardware mode pin configurations

Muting

MUTE_CTRL (Pin 31) is used to control the muting of the output and enabling of the Automute feature while in Hardware Mode:

- 0 – Output Muted, No Automute
- 1 – Output Unmuted, No Automute
- Pull 0 – Output Muted, Automute Enabled
- Pull 1 – Output Unmuted, Automute Enabled

Recommended Hardware Mode Setup Sequence

The hardware mode setup sequence is shown below with all hardware pins being defined after CHIP_EN is asserted.

Note: It is recommended that MUTE_CTRL is set low until the HW mode is finalized and after CHIP_EN is asserted, then asserted last.

Audio Input Formats

For configuring PCM, TDM, DSD, or S/PDIF, use Registers 57-71

PCM (subset of TDM interface)

Data is organized as 2 channels per data line. Any channel on any data line can be mapped to any DAC through the [TDM_CHx_CONFIG](#) channel mapping Registers 64-71. Data is latched on the positive edge of BCLK.

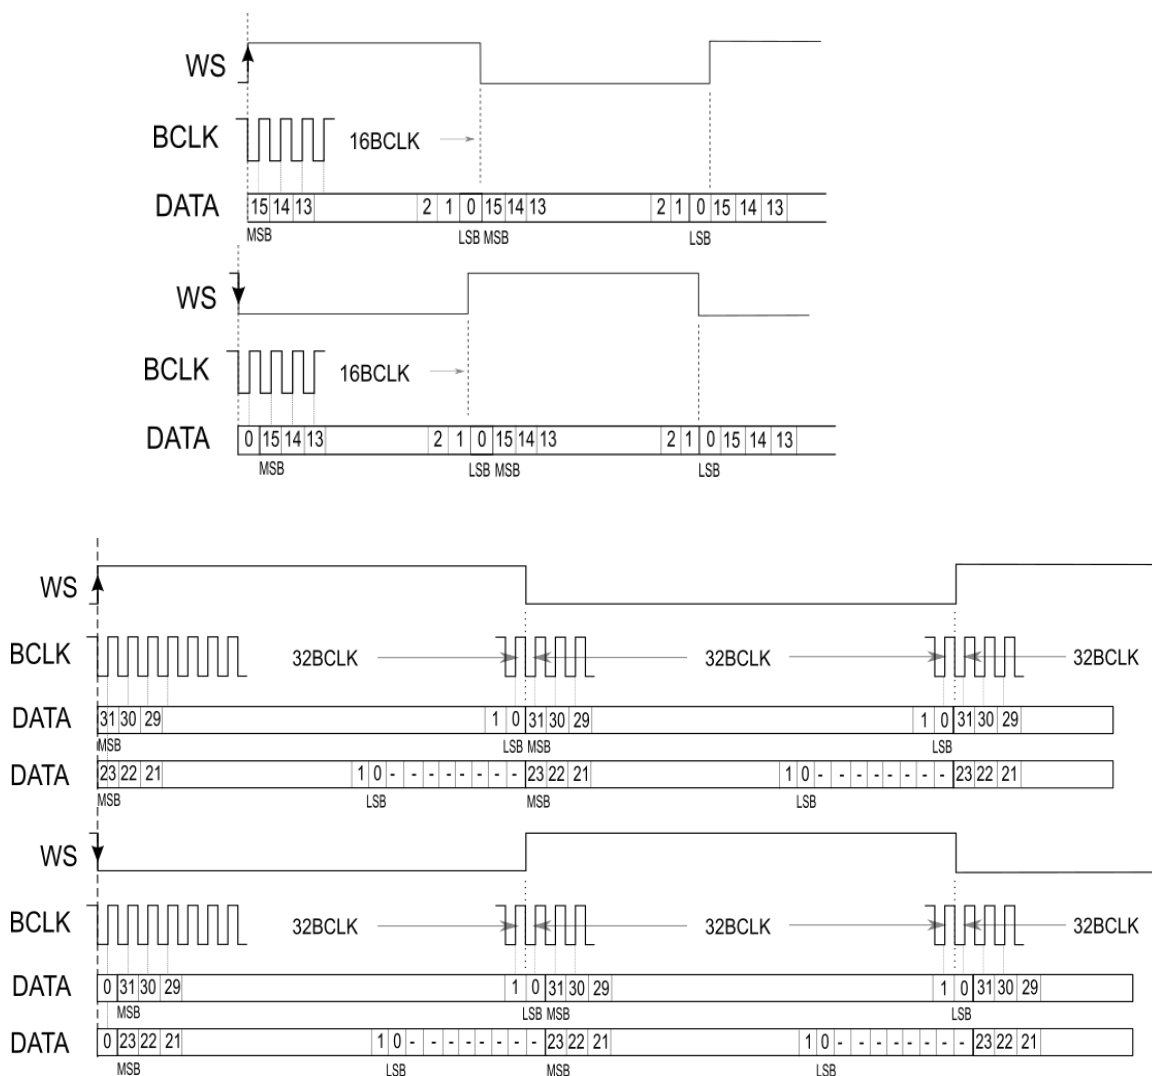

Figure 4 – I2S & L.J Input for 16bit and 32bit word depths

Time-division multiplexing (TDM)

ES9027PRO supports time-division multiplexing (TDM) format, allowing more than 2 channels (or slots) to be transmitted on each data line, up to a maximum of 32 channels per data line. Typical formats are TDM128 (4chx32bit), TDM256 (8chx32bit), TDM512 (16chx32bit) and TDM1024 (32chx32bit). In this mode, the [TDM_Chx_CONFIG](#) channel mapping Registers 64-71 can be used to internally map any slot (channel) to any DAC. Data is latched on the positive edge of BCLK.

Figure 5 – TDM128 mode

Figure 6 – TDM256 mode

Figure 7 – TDM512 mode

Figure 8 – TDM1024 mode

DSD¹

In DSD mode, there is a single DSD clock line, and each channel of data is an additional DSD data line. There is no internal channel mapping for DSD input, DSD data input to DATA1 is sent to Ch1, DSD data input to DATA2 is sent to Ch2, etc. For 4 channel and 2 channel applications, the interpolation path data can be copied from DAC1+DAC2 to the other DAC pairs, see Register 0[6:3] for details.

Figure 9 – DSD format, 1bit stream

S/PDIF

S/PDIF is transmitted over a single signal line using dual phase encoded data, which allows for clock extraction from the data signal line. In S/PDIF mode, there is only stereo data input. Channel 1 data will be sent to all odd channel DACs, Channel 2 data will be sent to all even channel DACs.

¹ The Automute Feature is not available when using DSD mode

Pre-Programmed Digital Filters

The ES9027PRO has 7 pre-programmed digital filters. The latency for each filter reduces (scales) with increasing sample rates. (See Register 88[2:0] for configuration). The 7 filters are:

- Minimum Phase (default)
- Linear Phase Apodizing
- Linear Phase Fast Roll-off
- Linear Phase Slow Roll-off
- Minimum Phase Fast Roll-off
- Minimum Phase Slow Roll-off
- Minimum Phase Slow Roll-off Low Dispersion

WARNING: Stresses beyond those listed under here may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied.

WARNING: Electrostatic Discharge (ESD) can damage this device. Proper procedures must be followed to avoid ESD when handling this device.

SPI Slave Interface

The 4-wire SPI data format is: Command (1 byte) + Address (1 byte) + Data

Register Overview

ES9027PRO contains read/write and read-only registers. A system clock must be present to access registers.

Multi-byte registers must be written from LSB to MSB. Data is latched when MSB is written.

Multi-byte registers must be read from LSB to MSB. Data is latched when LSB is read.

MSB is always stored in the highest register address.

Read/Write Register Addresses

Registers 0-141 (0x00 – 0x8D) are read/write registers

Read-only Register Addresses

Register 224-245 (0xE0 – 0xF5) are read registers

Multi-Byte Registers

Multi-byte registers must be written from LSB to MSB. Data is latched when MSB is written.

MSB is always stored in the highest register address.

Reflow Process Considerations

Temperature Controlled

For lead-free soldering, the characterization and optimization of the reflow process is the most important factor to consider.

The lead-free alloy solder has a melting point of 217°C. This alloy requires a minimum reflow temperature of 235°C to ensure good wetting. The maximum reflow temperature is in the 245°C to 260°C range, depending on the package size ([RPC-2 Pb-Free Process – Classification Temperatures \(T_c\)](#)). This narrows the process window for lead-free soldering to 10°C to 20°C.

The increase in peak reflow temperature in combination with the narrow process window makes the development of an optimal reflow profile a critical factor for ensuring a successful lead-free assembly process. The major factors contributing to the development of an optimal thermal profile are the size and weight of the assembly, the density of the components, the mix of large and small components, and the paste chemistry being used. Reflow profiling needs to be performed by attaching calibrated thermocouples well adhered to the device as well as other critical locations on the board to ensure that all components are heated to temperatures above the minimum reflow temperatures and that smaller components do not exceed the maximum temperature limits (Table RPC-2).

To ensure that all packages can be successfully and reliably assembled, the reflow profiles studied and recommended by ESS are based on the JEDEC/IPC standard J-STD-020 revision D.1.

Figure 22 – IR/Convection Reflow Profile (IPC/JEDEC J-STD-020D.1)

Reflow is allowed 3 times. Caution must be taken to ensure time between re-flow runs does not exceed the allowed time by the moisture sensitivity label. If the time elapsed between the re-flows exceeds the moisture sensitivity time bake the board according to the moisture sensitivity label instructions.

Manual

Allowed up to 2 times with maximum temperature of 350°C no longer than 3 seconds.

RPC-1 Classification reflow profile

Profile Feature	Pb-Free Assembly
Preheat/Soak	
Temperature Min (T _{min})	150°C
Temperature Max (T _{max})	200°C
Time (ts) from (T _{min} to T _{max})	60-120 seconds
Ramp-up rate (TL to T _p)	3°C / second maximum
Liquidous temperature (TL)	217°C
Time (t _L) maintained above TL	60-150 seconds
Peak package body temperature (T _p)	For users T _p must not exceed the classification temp in Table RPC-2. For suppliers T _p must equal or exceed the Classification temp in Table RPC-2.
Time (t _p)* within 5°C of the specified classification temperature (T _c)	30* seconds
Ramp-down rate (T _p to TL)	6°C / second maximum
Time 25°C to peak temperature	8 minutes maximum
* Tolerance for peak profile temperature (T _p) is defined as a supplier minimum and a user maximum.	

Table 14 – RPC-1 Classification reflow profile

All temperatures refer to the center of the package, measured on the package body surface that is facing up during assembly reflow (e.g., live-bug). If parts are reflowed in other than the normal live-bug assembly reflow orientation (i.e., dead-bug), T_p shall be within $\pm 2^\circ\text{C}$ of the live-bug T_p and still meet the T_c requirements, otherwise, the profile shall be adjusted to achieve the latter. To accurately measure actual peak package body temperatures, refer to JEP140 for recommended thermocouple use.

Reflow profiles in this document are for classification/preconditioning and are not meant to specify board assembly profiles. Actual board assembly profiles should be developed based on specific process needs and board designs and should not exceed the parameters in Table RPC-1.

For example, if T_c is 260°C and time t_p is 30 seconds, this means the following for the supplier and the user.

For a supplier: The peak temperature must be at least 260°C. The time above 255°C must be at least 30 seconds.

For a user: The peak temperature must not exceed 260°C. The time above 255°C must not exceed 30 seconds.

All components in the test load shall meet the classification profile requirements.

RPC-2 Pb-Free Process – Classification Temperatures (T_c)

Package Thickness	Volume mm ³ , <350	Volume mm ³ , 350 to 2000	Volume mm ³ , >2000
<1.6 mm	260°C	260°C	260°C
1.6 mm – 2.5 mm	260°C	250°C	245°C
>2.5 mm	250°C	245°C	245°C

Table 15 – RPC-2 Pb free classification temperatures

At the discretion of the device manufacturer, but not the board assembler/user, the maximum peak package body temperature (T_p) can exceed the values specified in Table RPC-2. The use of a higher T_p does not change the classification temperature (T_c).

Package volume excludes external terminals (e.g., balls, bumps, lands, leads) and/or nonintegral heat sinks.

The maximum component temperature reached during reflow depends on package thickness and volume. The use of convection reflow processes reduces the thermal gradients between packages. However, thermal gradients due to differences in thermal mass of SMD packages may still exist.
