

ESDA7P60-1U1M

High power transient voltage suppressor

Datasheet - production data

Features

- · Low clamping voltage
- · Typical peak pulse power:
 - 700 W (8/20µs)
- Stand off voltage 5 V
- Unidirectional diode
- Low leakage current:
 - 0.2 µA at 25 °C
- · RoHS compliant

Complies with the following standards:

- IEC 61000-4-2 level 4
 - ±30 kV (air discharge)
 - ±30 kV (contact discharge)

Applications

Where transient overvoltage protection in ESD sensitive equipment is required, such as:

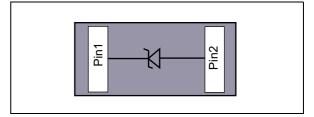

- Portable multimedia, tablets, mobile phone, smart phone
- USB V_{BUS} protection
- · Power supply protection
- Battery protection

Description

The ESDA7P60-1U1M is a unidirectional single line TVS diode designed to protect the power line against EOS and ESD transients.

The device is ideal for applications where high power TVS and board space saving are required.

3 Recommendation on PCB assembly

3.1 Stencil opening design

- 1. General recommendation on stencil opening design
 - a) Stencil opening dimensions: L (Length), W (Width), T (Thickness).

Figure 14. Stencil opening dimensions

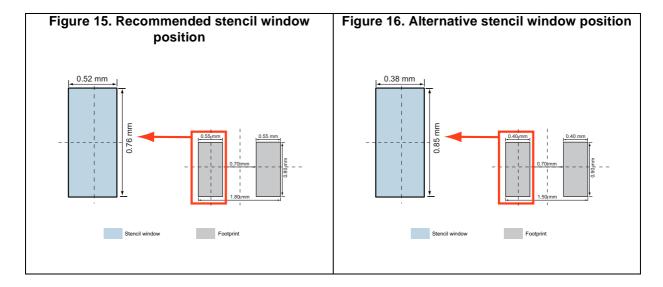

b) General design rule

Stencil thickness (T) = 75 \sim 125 μm

Aspect Ratio =
$$\frac{W}{T} \ge 1.5$$

Aspect Area =
$$\frac{L \times W}{2T(L+W)} \ge 0.66$$

- 2. Reference design
 - a) Stencil opening thickness: 100 μm
 - b) Stencil opening for leads: Opening to footprint ratio is 90%.

3.2 Solder paste

- 1. Use halide-free flux, qualification ROL0 according to ANSI/J-STD-004.
- 2. "No clean" solder paste recommended.
- 3. Offers a high tack force to resist component displacement during PCB movement.
- 4. Use solder paste with fine particles: powder particle size 20-45 μm.

3.3 Placement

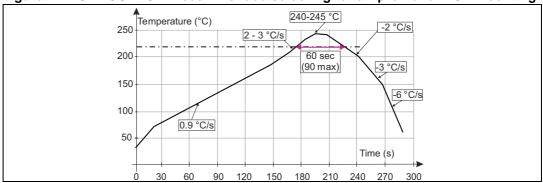

- 1. Manual positioning is not recommended.
- 2. It is recommended to use the lead recognition capabilities of the placement system, not the outline centering.
- 3. Standard tolerance of ± 0.05 mm is recommended.
- 4. 3.5 N placement force is recommended. Too much placement force can lead to squeezed out solder paste and cause solder joints to short. Too low placement force can lead to insufficient contact between package and solder paste that could cause open solder joints or badly centered packages.
- 5. To improve the package placement accuracy, a bottom side optical control should be performed with a high resolution tool.
- 6. For assembly, a perfect supporting of the PCB (all the more on flexible PCB) is recommended during solder paste printing, pick and place and reflow soldering by using optimized tools.

3.4 PCB design preference

- To control the solder paste amount, the closed via is recommended instead of open vias.
- 2. The position of tracks and open vias in the solder area should be well balanced. The symmetrical layout is recommended, in case any tilt phenomena caused by asymmetrical solder paste amount due to the solder flow away.

3.5 Reflow profile

Note: Minimize air convection currents in the reflow oven to avoid component movement.
