## 1.2 Pin Descriptions

Number	Name	Description
1, 4, 5, 6, 7, 8, 9, 12, 13, 16	NC	No internal connection. Renesas highly recommends connecting these pins to a ground via, which is located as close to the pin as possible.
2, 3	RFIN	RF input internally matched to 50Ω. Must use an external DC block.
10, 11	RFOUT	RF output. Pull up to V <sub>CC</sub> through inductor. Must use an external DC block.
14	VCC	Connect pin directly to VCC. Renesas recommends placing a 1000pF decoupling capacitor as close to this pin as possible.
15	I_REF	Reference current and STBY pin. Connect an external resistor (reference BOM) to V <sub>REF</sub> to set the quiescent current of the device. Setting V <sub>REF</sub> < 2V disables the amplifier.
	EPAD	Exposed paddle. Internally connected to ground. Solder this exposed paddle to a printed circuit board (PCB) pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple ground vias are also required to achieve the specified RF performance.

## 2. Specifications

## 5. Programming

The F1471 includes a STBY feature as defined in the following table.

**Table 1. STBY Truth Table**

V <sub>REF</sub> Voltage	State	Condition
V <sub>REF</sub> = 5V	Full operation	R <sub>BSET</sub> = See R5 in band specific BOM
V <sub>REF</sub> = 3.3V	Full operation	R <sub>BSET</sub> = See R5 in band specific BOM
V <sub>REF</sub> < 2V	Amplifier OFF	R <sub>BSET</sub> = See R5 in band specific BOM

## 6. Applications Information

The F1471 has been optimized for use in high performance RF applications from 400MHz to 4200MHz.

### 6.1 Power Supplies

Use a common V<sub>CC</sub> power supply for all power supply pins. To minimize noise and fast transients, de-coupling capacitors to all supply pins. Supply noise can degrade noise figure and fast transients can trigger ESD clamps causing them to fail. Supply voltage changes or transients should have a slew rate smaller than 1V/20μs. In addition, keep all control pins at 0V (±0.3V) while the supply voltage ramps or while it returns to zero.

## 7.3 Evaluation Kit Operation

### 7.3.1. Power Supply Setup

Set up a power supply in the voltage range of 4.75V to 5.25V with the power supply output disabled. The voltage is applied using the following connection (see Figure 26):

- Directly to the J2 SMA connector

Set up a control supply of either 3.3V or 5V (Use the correct value of resistance (R5) based on the applied control voltage as indicated per the BOM). The voltage is applied using the following connection (see Figure 26):

- Directly to the J3 SMA connector

### 7.3.2. Shunt Jumper Setup

- J7 Header Pins

- Always place the Shunt Jumper to bias the amplifier output (see Evaluation Schematic in Figure 27).

- J6 Header Pins

- J6 Header pins provide the  $V_{CC}$  and  $V_{REF}$  voltages to the DUT.
- Always place a shunt jumper on pins 5 and 6 to provide the supplied  $V_{CC}$  to the DUT.
- Place a shunt jumper on pins 3 and 4. In this configuration,  $V_{REF}$  is set independent to the supply voltage,  $V_{CC}$ .
- Place a shunt jumper on pins 1 and 2. In this configuration,  $V_{REF}$  is set to the same level as the supply voltage,  $V_{CC}$ .
- Only place jumpers on Pins 3 and 4 or Pins 1 and 2 at any given time.  
**Important:** Do not place jumpers on all four pins (1, 2, 3, and 4) simultaneously.

### 7.3.3. Power-On Procedure

1. Set up the voltage supplies, and Evaluation Board as described in the Power Supply Setup section.
2. Enable the  $V_{CC}$  supply.
3. Enable the  $V_{REF}$  supply.

### 7.3.4. Power-Off Procedure

Disable the  $V_{REF}$  supply and then disable the  $V_{CC}$  power supply.
