

# FAN48610

## 2.5 MHz, Fixed-Output Synchronous TinyBoost® Regulator

### Features

- Input Voltage Range: 2.35 V to 5.50 V
- Output Voltages Range: 3.0 V to 5.0 V
- $I_{OUT} \geq 1 \text{ A}$  at  $V_{OUT} = 5.0 \text{ V}$ ,  $V_{IN} \geq 2.5 \text{ V}$
- $I_{OUT} \geq 1.5 \text{ A}$  at  $V_{OUT} = 5.0 \text{ V}$ ,  $V_{IN} \geq 3.0 \text{ V}$
- Up to 94% Efficient
- Automatic Pass-Through Operation when  $V_{IN} > V_{OUT}$
- Internal Synchronous Rectification
- Soft-Start with True Load Disconnect
- Short-Circuit Protection
- 9-Bump, 1.215 mm x 1.215 mm, 0.4 mm Pitch WLCSP
- Three External Components: 2016 0.47  $\mu\text{H}$  Inductor, 0603 Case Size Input / Output Capacitors
- Total Application Board Solution Size: < 11 mm<sup>2</sup>

### Applications

- Class-D Audio Amplifier and USB OTG Supply
- Boost for Low-Voltage Li-Ion Batteries
- Smart Phones, Tablets, Portable Devices

### Description

The FAN48610 is a low-power boost regulator designed to provide a minimum voltage-regulated rail from a standard single-cell Li-Ion battery and advanced battery chemistries. Even below the minimum system battery voltage, the device maintains the output voltage regulation for a minimum output load current of 1.0 A. The combination of built-in power transistors, synchronous rectification, and low supply current suit the FAN48610 for battery-powered applications.

The FAN48610 is available in a 9-bump, 0.4 mm pitch, Wafer-Level Chip-Scale Package (WLCSP).

Figure 1. Typical Application

### Ordering Information

Part Number	V <sub>OUT</sub>	Operating Temp	Package	Packing <sup>(1)</sup>
FAN48610UC50X	5.0 V	-40°C to 85°C	WLCSP, 0.4 mm Pitch	Tape and Reel
FAN48610BUC50X <sup>(2)</sup>	5.0 V	-40°C to 85°C	WLCSP, 0.4 mm Pitch	Tape and Reel

#### Notes:

1. Please refer to Application Note AN-6054 — *Tape and Reel Specifications* on [www.fairchildsemi.com](http://www.fairchildsemi.com).
2. The FAN48610BUC50X includes backside lamination.

## Block Diagrams

## Pin Configuration

Figure 3. Top View

Figure 4. Bottom View

## Pin Definitions

Pin #	Name	Description
A1, A2	VOUT	<b>Output Voltage.</b> This pin is the output voltage terminal; connect directly to C <sub>OUT</sub> .
A3	VIN	<b>Input Voltage.</b> Connect to Li-Ion battery input power source and the bias supply for the gate drivers.
B1, B2	SW	<b>Switching Node.</b> Connect to inductor.
B3	EN	<b>Enable.</b> When this pin is HIGH, the circuit is enabled.
C1, C2	PGND	<b>Power Ground.</b> This is the power return for the IC. C <sub>OUT</sub> capacitor should be returned with the shortest path possible to these pins.
C3	AGND	<b>Analog Ground.</b> This is the signal ground reference for the IC. All voltage levels are measured with respect to this pin – connect to PGND at a single point.

## Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter		Min.	Max.	Unit
$V_{IN}$	Voltage on VIN Pin		-0.3	6.0	V
$V_{OUT}$	Voltage on VOUT Pin			6.0	V
SW	SW Node	DC	-0.3	6.0	V
		Transient: 10 ns, 3 MHz	-1.0	8.0	
	Voltage on Other Pins		-0.3	6.0 <sup>(3)</sup>	V
ESD	Electrostatic Discharge Protection Level	Human Body Model per JESD22-A114	5		kV
		Charged Device Model per JESD22-C101	2		
$T_J$	Junction Temperature		-40	+150	°C
$T_{STG}$	Storage Temperature		-65	+150	°C
$T_L$	Lead Soldering Temperature, 10 Seconds			+260	°C

### Note:

- Lesser of 6.0 V or  $V_{IN} + 0.3$  V.

## Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

Symbol	Parameter	Min.	Max.	Unit
$V_{IN}$	Supply Voltage	2.5	4.5	V
$I_{OUT}$	Maximum Output Current	1000		mA
$T_A$	Ambient Temperature	-40	+85	°C
$T_J$	Junction Temperature	-40	+125	°C

## Thermal Properties

Junction-to-ambient thermal resistance is a function of application and board layout. This data is measured with four-layer 2s2p boards with vias in accordance to JEDEC standard JESD51. Special attention must be paid not to exceed junction temperature,  $T_{J(max)}$ , at a given ambient temperature,  $T_A$ .

Symbol	Parameter	Typical	Unit
$\theta_{JA}$	Junction-to-Ambient Thermal Resistance	50	°C/W

## Electrical Specifications

Recommended operating conditions, unless otherwise noted, circuit per Figure 1,  $V_{OUT}$  = 3.0 V to 5.0 V,  $V_{IN}$  = 2.5 V to 4.5 V,  $T_A$  = -40°C to 85°C. Typical values are given  $V_{IN}$  = 3.6 V and  $T_A$  = 25°C.

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Units

## Circuit Description

FAN48610 is a synchronous boost regulator, typically operating at 2.5 MHz in Continuous Conduction Mode (CCM), which occurs at moderate to heavy load current and low  $V_{IN}$  voltages. The regulator's Pass-Through Mode automatically activates when  $V_{IN}$  is above the boost regulator's set point.

**Table 2. Operating Modes**

Mode	Description	Invoked When:
LIN	Linear Startup	$V_{IN} > V_{OUT}$
SS	Boost Soft-Start	$V_{IN} < V_{OUT} < V_{OUT(TARGET)}$
BST	Boost Operating Mode	$V_{OUT} = V_{OUT(TARGET)}$
PT	Pass-Through Mode	$V_{IN} > V_{OUT(TARGET)}$

## Boost Mode Regulation

The FAN48610 uses a current-mode modulator to achieve excellent transient response and smooth transitions between CCM and DCM operation. During CCM operation, the device maintains a switching frequency of about 2.5 MHz. In light-load operation (DCM), frequency is naturally reduced to maintain high efficiency.

## Shutdown and Startup

When EN is LOW, all bias circuits are off and the regulator is in Shutdown Mode. During shutdown, current flow is prevented from VIN to VOUT, as well as reverse flow from VOUT to VIN. It is recommended to keep load current draw below 500 mA until the devices successfully executes startup. The following table describes the startup sequence.

**Table 3. Boost Startup Sequence**

Start Mode	Entry	Exit	End Mode	Timeout (μs)
LIN1	$V_{IN} > V_{UVLO}$ , EN=1	$V_{OUT} > V_{IN} - 300 \text{ mV}$	SS	
		TIMEOUT	LIN2	512
LIN2	LIN1 Exit	$V_{OUT} > V_{IN} - 300 \text{ mV}$	SS	
		TIMEOUT	FAULT	1024
SS	LIN1 or LIN2 Exit	$V_{OUT} = V_{OUT(TARGET)}$	BST	
		OVERLOAD TIMEOUT	FAULT	64

## LIN Mode

When EN is HIGH and  $V_{IN} > V_{UVLO}$ , the regulator first attempts to bring  $V_{OUT}$  within 300 mV of  $V_{IN}$  by using the internal fixed-current source from VIN (Q2). The current is limited to the LIN1 set point.

If  $V_{OUT}$  reaches  $V_{IN} - 300 \text{ mV}$  during LIN1 Mode, the SS Mode is initiated. Otherwise, LIN1 times out after 512 μs and LIN2 Mode is entered.

In LIN2 Mode, the current source is incremented to 1.6 A. If  $V_{OUT}$  fails to reach  $V_{IN} - 300 \text{ mV}$  after 1024 μs, a fault condition is declared and the device waits 20 ms to attempt an automatic restart.

## Soft-Start (SS) Mode

Upon the successful completion of LIN Mode ( $V_{OUT} \geq V_{IN} - 300 \text{ mV}$ ), the regulator begins switching with boost pulses current limited to 50% of nominal level.

During SS Mode, if  $V_{OUT}$  fails to reach regulation during the SS ramp sequence for more than 64 μs, a fault is declared. If large  $C_{OUT}$  is used, the reference is automatically stepped slower to avoid excessive input current draw.

## Boost (BST) Mode

This is a normal operating mode of the regulator.

## Pass-Through (PT) Mode

In normal operation, the device automatically transitions from Boost Mode to Pass-Through Mode if  $V_{IN}$  goes above the target  $V_{OUT}$ . In Pass-Through Mode, the device fully enhances Q2 to provide a very low impedance path from VIN to VOUT. Entry to the Pass-Through Mode is triggered by condition where  $V_{IN} > V_{OUT}$  and no switching has occurred during the past 5 μs. To soften the entry into Pass-Through Mode, Q2 is driven as a linear current source for the first 5 μs. Pass-Through Mode exit is triggered when  $V_{OUT}$  reaches the target  $V_{OUT}$  voltage. During Automatic Pass-Through Mode, the device is short-circuit protected by a voltage comparator tracking the voltage drop from  $V_{IN}$  to  $V_{OUT}$ ; if the drop exceeds 300 mV, a fault is declared.

## Fault State

The regulator enters Fault State under any of the following conditions:

- $V_{OUT}$  fails to achieve the voltage required to advance from LIN Mode to SS Mode.
- $V_{OUT}$  fails to achieve the voltage required to advance from SS Mode to BST Mode.
- Boost current limit triggers for 2 ms during BST Mode.
- $V_{IN} - V_{OUT} > 300 \text{ mV}$ ; this fault can occur only after successful completion of the soft-start sequence.
- $V_{IN} < V_{UVLO}$ .

Once a fault is triggered, the regulator stops switching and presents a high-impedance path between VIN and VOUT. After waiting 20 ms, an automatic restart is attempted.

## Over-Temperature

The regulator shuts down if the die temperature exceeds 150°C. Restart occurs when the IC has cooled by approximately 20°C.

## Application Information

### Output Capacitance (C<sub>OUT</sub>)

The effective capacitance (C<sub>EFF</sub><sup>(6)</sup>) of small, high-value ceramic capacitors decreases as their bias voltage increases, as illustrated in the graph below:

**Figure 29. C<sub>EFF</sub> for 22 µF, 0603, X5R, 6.3 V-Rated Capacitor (TDK C1608X5R0J226M)**

FAN48610 is guaranteed for stable operation with the minimum value of C<sub>EFF</sub> (C<sub>EFF(MIN)</sub>) outlined in Table 4.

**Table 4. Minimum C<sub>EFF</sub> Required for Stability**

Operating Conditions			C <sub>EFF(MIN)</sub> (µF)
V <sub>OUT</sub> (V)	V <sub>IN</sub> (V)	I <sub>LOAD</sub> (mA)	
5.0	2.5 to 4.5	0 to 1000	3.0

**Note:**

- C<sub>EFF</sub> varies by manufacturer, capacitor material, and case size.

### Inductor Selection

Recommended nominal inductance value is 0.47 µH.

The FAN48610 employs valley-current limiting, so peak inductor current can reach 3.8 A for a short duration during overload conditions. Saturation effects cause the inductor current ripple to become higher under high loading, as only the valley of the inductor current ripple is controlled.

### Startup

Input current limiting is in effect during soft-start, which limits the current available to charge C<sub>OUT</sub> and any additional capacitance on the V<sub>OUT</sub> line. If the output fails to achieve regulation within the limits described in the Soft-Start section above, a fault occurs, causing the circuit to shut down. It waits about 20 ms before attempting a restart. If the total combined output capacitance is very high, the circuit may not start on the first attempt, but eventually achieves regulation if no load is present. If a high current load and high capacitance are both present during soft-start, the circuit may fail to achieve regulation and continually attempt soft-start, only to have the output capacitance discharged by the load when in Fault State.

### Output Voltage Ripple

Output voltage ripple is inversely proportional to C<sub>OUT</sub>. During t<sub>ON</sub>, when the boost switch is on, all load current is supplied by C<sub>OUT</sub>.

$$V_{RIPPLE(P-P)} = t_{ON} \cdot \frac{I_{LOAD}}{C_{OUT}} \quad \text{EQ. 1}$$

and

$$t_{ON} = t_{SW} \cdot D = t_{SW} \cdot \left(1 - \frac{V_{IN}}{V_{OUT}}\right) \quad \text{EQ. 2}$$

therefore:

$$V_{RIPPLE(P-P)} = t_{SW} \cdot \left(1 - \frac{V_{IN}}{V_{OUT}}\right) \cdot \frac{I_{LOAD}}{C_{OUT}} \quad \text{EQ. 3}$$

$$t_{SW} = \frac{1}{f_{SW}} \quad \text{EQ. 4}$$

The maximum V<sub>RIPPLE</sub> occurs when V<sub>IN</sub> is minimum and I<sub>LOAD</sub> is maximum. For better ripple performance, more output capacitance can be added.

### Layout Recommendations

The layout recommendations below highlight various top-copper pours by using different colors.

To minimize spikes at V<sub>OUT</sub>, C<sub>OUT</sub> must be placed as close as possible to PGND and V<sub>OUT</sub>, as shown below.

For thermal reasons, it is suggested to maximize the pour area for all planes other than SW. Especially the ground pour should be set to fill all available PCB surface area and tied to internal layers with a cluster of thermal vias.

**Figure 30. Layout Recommendation**

**LIFE SUPPORT POLICY**

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

**ANTI-COUNTERFEITING POLICY**

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, [www.fairchildsemi.com](http://www.fairchildsemi.com), under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.
