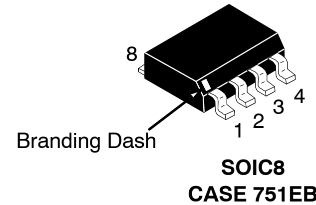
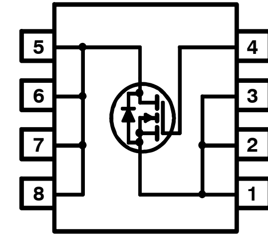
# MOSFET – N-Channel, POWERTRENCH®

## 80 V, 8.9 A, 16 mΩ

# FDS3572



**SOIC8**
**CASE 751EB**



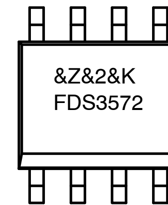
### Features

- $R_{DS(ON)}$ = 14 Ω (Typ.), $V_{GS}$ = 10 V, $I_D$ = 8.9 A
- $Q_{g(tot)}$ = 31 nC (Typ.), $V_{GS}$ = 10 V
- Low Miller Charge
- Low $Q_{RR}$ Body Diode
- Optimized Efficiency at High Frequencies
- UIS Capability (Single Pulse and Repetitive Pulse)
- This Device is Pb−Free and Halide Free

### Applications

- Primary Switch for Isolated DC−DC Converters
- Distributed Power and Intermediate Bus Architectures
- High Voltage Synchronous Rectifier for DC Bus Converters

### MARKING DIAGRAM



&Z = Assembly Plant Code
&2 = Date Code (Year & Week)
&K = Lot Traceability Code
FDS3572 = Specific Device Code

### ORDERING INFORMATION

| Device | Package | Shipping |
|---|---|---|
| FDS3572 | SOIC8 (Pb−Free) | 2,500 / Tape & Reel |

†For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specification Brochure, BRD8011/D.

### ABSOLUTE MAXIMUM RATINGS

($T_A$ = 25°C unless otherwise noted.)

| Symbol | Parameter | Ratings | Unit |
|---|---|---|---|
| $V_{DSS}$ | Drain to Source Voltage | 80 | V |
| $V_{GS}$ | Gate to Source Voltage | ±20 | V |
| $I_D$ | Drain Current<br>Continuous<br>($T_A$ = 25°C, $V_{GS}$ = 10 V, $R_{θJA}$ = 50°C/W)<br>($T_A$ = 100°C, $V_{GS}$ = 10 V, $R_{θJA}$ = 50°C/W)<br>Pulsed | <br><br>8.9<br>5.6<br>Fig. 4 | A |
| $E_{AS}$ | Single Pulse Avalanche Energy (Note 1) | 515 | mJ |
| $P_D$ | Power Dissipation | 2.5 | W |
| | Derate above 25°C | 20 | mW/°C |
| $T_J$, $T_{STG}$ | Operating and Storage Temperature | −55 to +150 | °C |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

### THERMAL CHARACTERISTICS

| Symbol | Parameter | Value | Unit |
|---|---|---|---|
| $R_{θJC}$ | Thermal Resistance, Junction−to−Case (Note 2) | 25 | °C/W |
| $R_{θJA}$ | Thermal Resistance, Junction−to−Ambient at 10 seconds (Note 3) | 50 | °C/W |
| | Thermal Resistance, Junction−to−Ambient at 1000 seconds (Note 3) | 85 | °C/W |

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

NOTES:
1. Starting $T_J$ = 25°C, L = 21mH, $I_{AS}$ = 7 A.
2. $R_{\theta JA}$ is the sum of the junction−to−case and case−to−ambient resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. $R_{\theta JC}$ is guaranteed by design while $R_{\theta CA}$ is determined by the user’s board design.
3. $R_{\theta JA}$ is measured with 1.0 $in^2$ copper on FR−4 board.

## THERMAL RESISTANCE VS. MOUNTING PAD AREA

The maximum rated junction temperature, $T_{JM}$, and the thermal resistance of the heat dissipating path determines the maximum allowable device power dissipation, $P_{DM}$, in an application. Therefore the application's ambient temperature, $T_A$ (°C), and thermal resistance $R_{\theta JA}$ (°C/W) must be reviewed to ensure that $T_{JM}$ is never exceeded. Equation 1 mathematically represents the relationship and serves as the basis for establishing the rating of the part.

$$P_{DM} = \frac{(T_{JM} - T_A)}{R_{\theta JA}} \qquad \text{(eq. 2)}$$

In using surface mount devices such as the SO8 package, the environment in which it is applied will have a significant influence on the part's current and maximum power dissipation ratings. Precise determination of $P_{DM}$ is complex and influenced by many factors:

1. Mounting pad area onto which the device is attached and whether there is copper on one side or both sides of the board.
2. The number of copper layers and the thickness of the board.
3. The use of external heat sinks.
4. The use of thermal vias.
5. Air flow and board orientation.
6. For non steady state applications, the pulse width, the duty cycle and the transient thermal response of the part, the board and the environment they are in.

**onsemi** provides thermal information to assist the designer's preliminary application evaluation. Figure 20 defines the $R_{\theta JA}$ for the device as a function of the top copper (component side) area. This is for a horizontally positioned FR–4 board with 1 oz copper after 1000 seconds of steady state power with no air flow. This graph provides the necessary information for calculation of the steady state junction temperature or power dissipation. Pulse applications can be evaluated using the **onsemi** device Spice thermal model or manually utilizing the normalized maximum transient thermal impedance curve.

Thermal resistances corresponding to other copper areas can be obtained from Figure 20 or by calculation using Equation 3. The area, in square inches or square centimeters is the top copper area including the gate and source pads.

$$R_{\theta JA} = 64 + \frac{26}{(0.23 + \text{Area})} \qquad \text{(eq. 3)}$$

The transient thermal impedance ($Z_{\theta JA}$) is also effected by varied top copper board area. Figure 21 shows the effect of copper pad area on single pulse transient thermal impedance. Each trace represents a copper pad area in square inches corresponding to the descending list in the graph. Spice and SABER thermal models are provided for each of the listed pad areas.

Copper pad area has no perceivable effect on transient thermal impedance for pulse widths less than 100 ms. For pulse widths less than 100ms the transient thermal impedance is determined by the die and package. Therefore, CTHERM1 through CTHERM5 and RTHERM1 through RTHERM5 remain constant for each of the thermal models. A listing of the model component values is available in Table 1.
