

**DUAL PWM CONTROL IC  
WITH SCP/DTC FUNCTION****GENERAL DESCRIPTION**

The **FP5452**, a 1-chip composed of totem-pole output stage pulse-width-modulation control circuits with two error amplifiers and dead-time comparators (DTC), the **FP5452** contains a 2.5V precision voltage reference regulator, under-voltage lockout circuit (UVLO), short circuit protection circuit (SCP), applied to offer space and low cost in many applications such as the DC/DC converter and backlight inverter.

Using few external components, FP5452, a high performance integrated IC, is designed for a control circuit. The circuit diagram of the typical application example is as below.

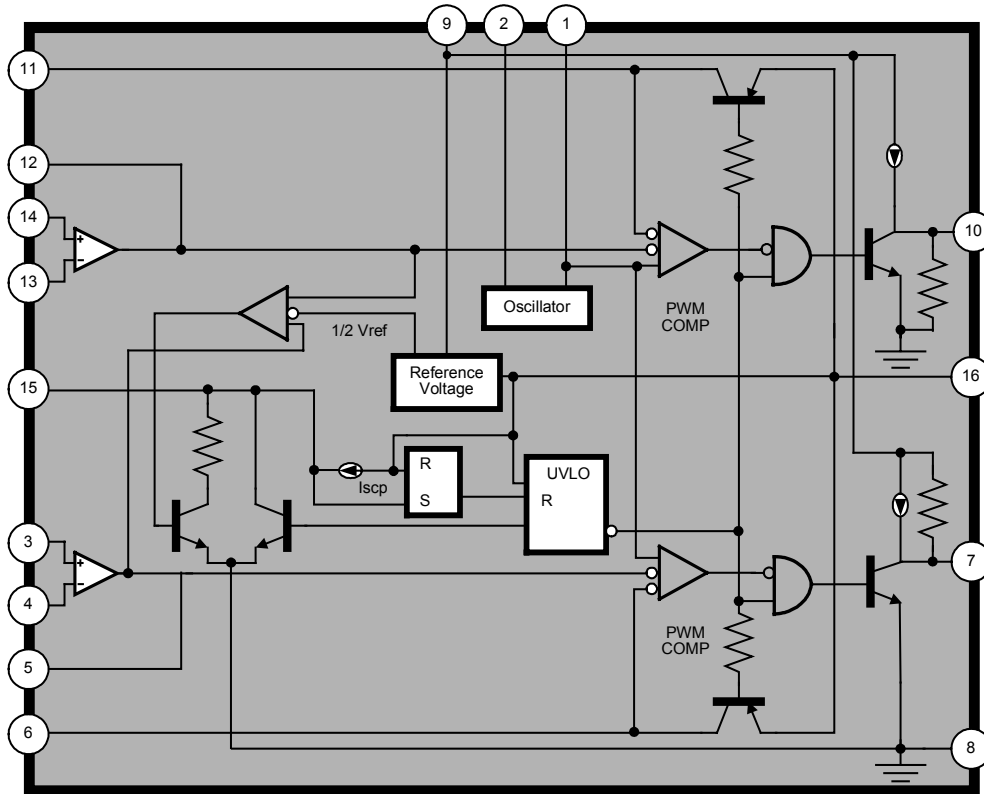

**FEATURES**

- Fixed Reference Voltage: 2.5V
- Reference Voltage Precision: 2% (FP5452)
- Totem-pole output stage
- Low quiescent supply current under 3.5mA
- Wide operating voltage range: 3.6~40V
- Variable dead-time control (DTC)
- UVLO protection function
- SCP protection function (threshold voltage: 1.3V)
- Oscillator Frequency: Max. 500KHz
- Package: SOP16/PDIP16/SSOP16

**SOP16****PDIP 16****SSOP 16****TYPICAL APPLICATION**

- DC/DC converters for video cameras and TFT LCD monitor etc.
- Back light CCFL inverter.

## DETAILED DESCRIPTION

### Voltage Reference

FP5452 has an internal 2.5V reference regulator using for the internal circuits' voltage bias, and another function is using with the resistive divider connecting to the IC error amplifier inverting input for output feedback reference(see Fig 18).

**Figure 18 Reference and error amplifiers with resistive dividers**

The error amplifier inverting input (EA1- or EA2-) reference voltage formulas are shown as below:

$$V_{EA1-} = VREF(2.5V) \times \frac{R2}{R1 + R2}$$

$$V_{EA2-} = VREF(2.5V) \times \frac{R4}{R3 + R4}$$

And we will discuss both relationship of the output voltage and error amplifier reference voltage next page.

## Error Amplifier

The error amplifiers of **FP5452** compare the feedback voltage from the resistive dividers of dc-dc converter output to the reference bias(see Fig 19), and generate the error signal for the PWM comparator, the relation formulas are shown as below:

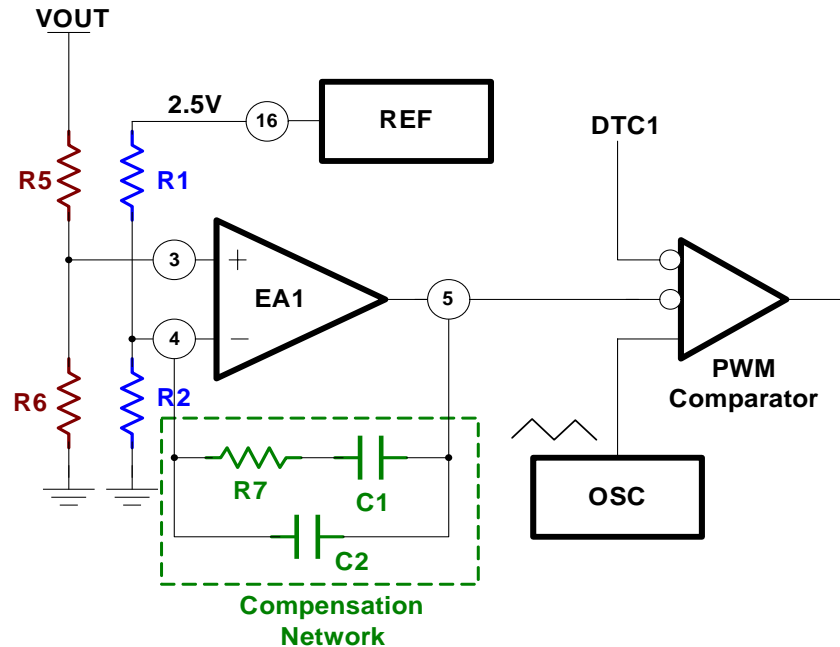

Figure 19 Error amplifier with Feedback/Compensation Circuits

The Buck converter output voltage:

$$V_{OUT} = \left(1 + \frac{R5}{R6}\right) \times \left(\frac{R2}{R1 + R2}\right) \times 2.5V$$

Error Amplifier Gain:

$$A_v = 1 + \frac{1 + sR7C1}{sRi(C1 + C2)(1 + sR7C2)} \quad , Ri = R1 // R2$$

Error Amplifier Zero and Pole Frequency:

$$F_z = \frac{1}{2\pi R7C1} \quad , \quad F_p = \frac{1}{2\pi R7C2}$$

## Oscillator/PWM Comparator

The oscillator frequency can be decided from 20KHz to 500KHz by the resistor (RT) and capacitor (CT) which are connected with pin1 and pin2 of **FP5452**, a sawtooth waveform would compare with feedback signal of the error amplifier and dead-time control voltage, the figure 20 is the relationship of oscillator, error amplifier and PWM comparator, and figure 21 is the waveforms of **FP5452**.

Figure 20 Oscillator/PWM Comparator with Frequency RC circuits

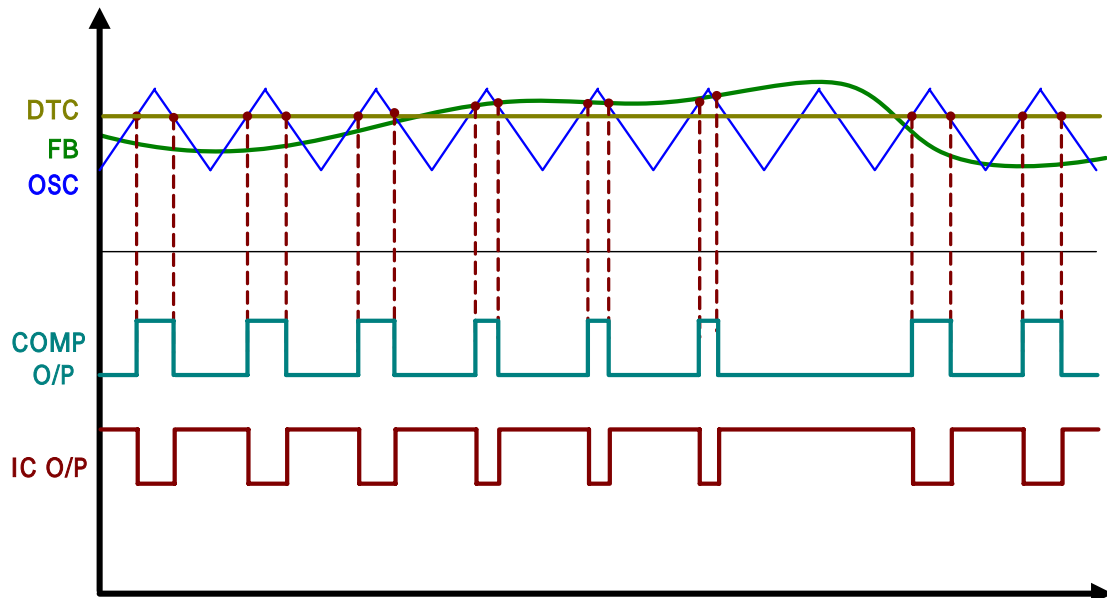

Figure 21 FP5452 Timing Waveforms

The relationship of oscillator waveform and dead-time voltage is shown below (see Fig 22):

**Figure 22 Oscillator Frequency with DTC voltage**

The oscillator frequency calculation formula is shown as below:

$$f = \frac{VT}{2 * CT * RT * (V_{zero} - V_{max.})}$$

**Dead-Time Control/Soft-Start**

The dead-time control (DTC) is a function for the PWM duty cycle limitation, if the DTC voltage is lower than DTC maximum voltage (typ. 1.35V), the PWM duty cycle can change to 100% cycle; and if the DTC voltage is higher than DTC zero voltage (typ. 2.05V), the PWM duty cycle should always turn-off (zero duty).

The system of DC-DC converter can use DTC function with an external RC for Power-On soft-start (see Fig 23) and a simple formula to calculate the soft-start time.

**Figure 23 DTC Soft-start RC circuit and waveform**

The soft-start time formula:

$$t = 0.616 * R8C3$$

## Short Circuit Protection

FP5452 has a protection function when short circuit is occurred, when the DC-DC converter feedback voltage is drop a very low voltage, the error amplifier IN+ pin would also have a low feedback voltage, the output of error amplifier will generate a low voltage state to compare a 1.25V of the SCP comparator, and SCP comparator should turn-off the transistor Q1 and SCP capacitor is charged to a threshold voltage (typ. 1.3V) for latched the off state of PWM output and source the DTC current to bias a zero duty condition and reset the SCP pin voltage by Q2 transistor (see Fig 24).

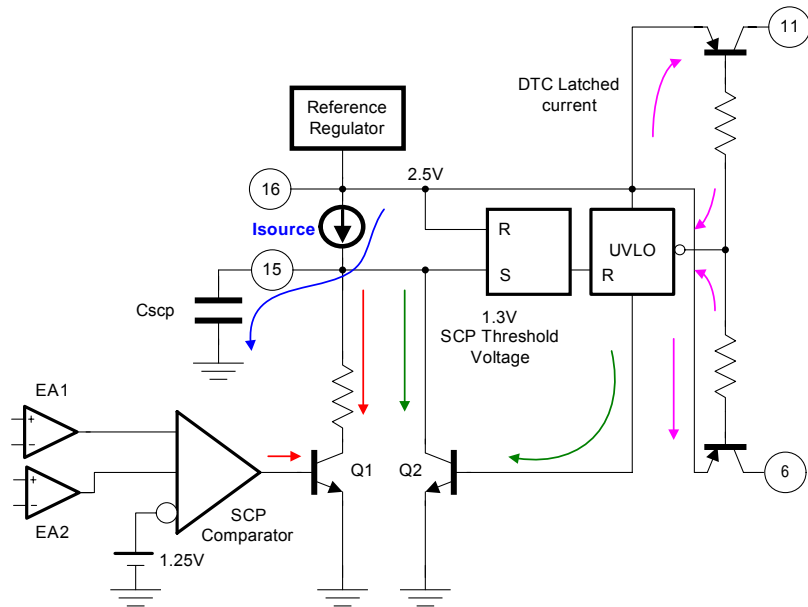

Figure 24 Internal SCP Detection/Control Circuits

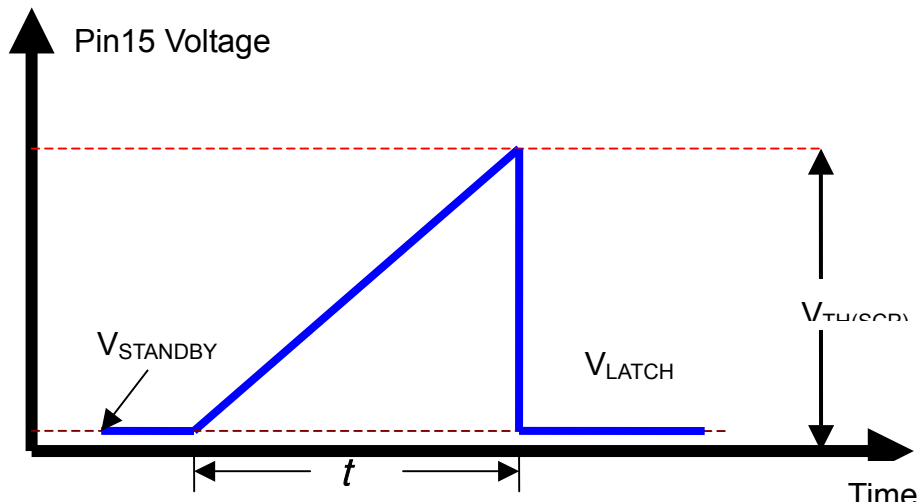

Figure 25 SCP waveform (SCP active)

The SCP time formula is:

$$t = \frac{C_{SCP} * (V_{th(sc)} - V_{sb})}{I_{source}}$$

## APPLICATION NOTE

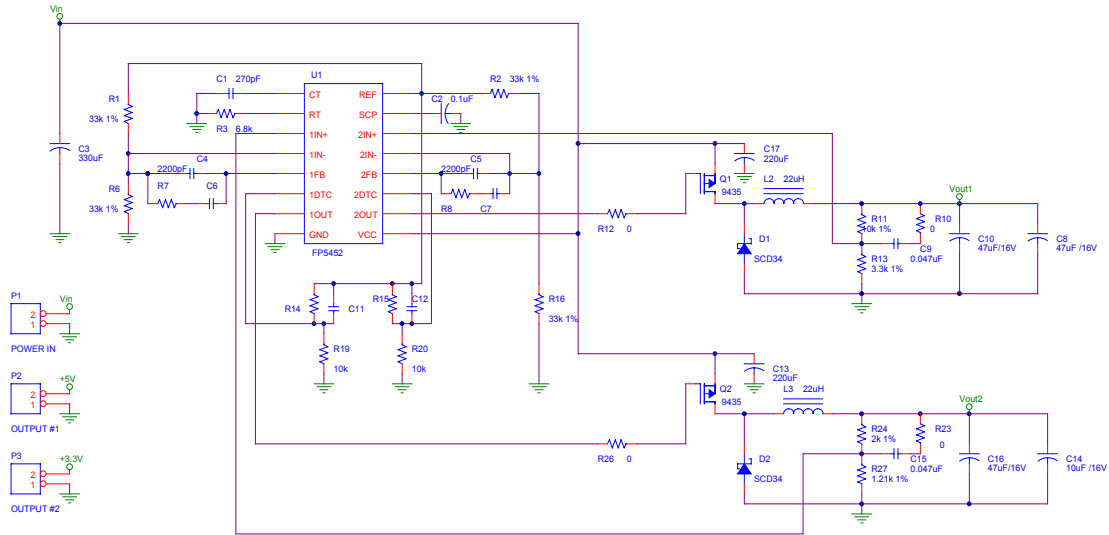

Figure 26 FP5452 2-channel Buck Regulators Application Circuits

### Note

- The IN1- and IN2- is 1.25V a half of VREF voltage because R1=R6 and R2=R16.
- The R14-R19-C11 and R15-R20-C12 are a DTC circuits for Buck Regulators power-on.
- The R11-R13 and R24-R27 are the buck regulator output voltage feedback resistances.
- The R7-C4-C6 is the compensation circuit for error amplifier 1 of **FP5452**.
- The R8-C5-C7 is the compensation circuit for error amplifier 2 of **FP5452**.
- The R3-C1 is an external RC circuit for **FP5452** internal oscillator.
- The C2 is **FP5452** short circuit protection delay time capacitor.

| $\theta$     | 0          | 7     | 15    |

### NOTES:

- JEDEC OUTLINE: MS-001 BB
- "D", "E1" DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS. MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .010 INCH.  
 $e_{\theta}$  IS MEASURED AT THE LEAD TIPS WITH THE LEADS UNCONSTRAINED.  
POINTED OR ROUNDED LEAD TIPS ARE PREFERRED TO EASE INSERTION.
- DISTANCE BETWEEN LEADS INCLUDING DAM BAR PROTRUSIONS TO BE .005 INCH MINIMUM.
- DATUM PLANE COINCIDENT WITH THE BOTTOM OF LEAD, WHERE LEAD EXITS BODY.
