

100mA Ultra-Low Quiescent Current Low Dropout Regulator

Description

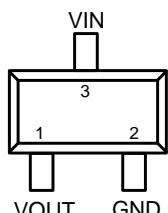

The FP6141 is a CMOS low dropout voltage (LDO) regulator with ultra-low quiescent current of 4µA, designed for battery-operated applications. Wide range of output voltages can be used, ranging from 1.2V to 3.3V.

Other features include current limit protection, thermal shutdown protection and high output voltage accuracy. The requirement of only 1µF input and output capacitor makes it ideal in space-sensitive applications.

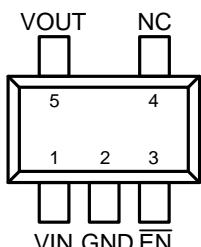

The FP6141 is available in space saving SOT-23-3, SOT-23-5 and TDFN-6 packages.

Features

- Ultra-Low Quiescent Current at 4µA
- High Output Voltage Accuracy at ±2%
- Low Dropout Voltage of 250mV at 100mA
- Operating Voltage Range from 2V to 5.5V
- Current Limit Protection
- Thermal Shutdown Protection
- 1µF Output Capacitor Required for Stability
- Chip Enable Control (FP6141XXS5 and FP6141XXWD only)
- RoHS Compliant

Applications

- Battery-Powered Equipment
- Notebook Computer
- Hand-Held Instrument
- DSC

Application Information

The FP6141 is suitable for power saving battery application with ultra-low $4\mu A$ quiescent current. Current limit and on chip thermal shutdown features provide protection against any combination of overload or ambient temperature that could exceed maximum junction temperature.

Shutdown Control

Force \overline{EN} pin low to enable the FP6141 and turn off the device by pulling it high. The \overline{EN} pin can't be left floating and must be tied to the ground if not used.

Thermal Shutdown

Thermal shutdown is employed to prevent the device damaged from the junction temperature exceeding safe margins mainly due to short circuit or current limit. Moreover, the device will return to normal operation when the junction temperature is down to a constant temperature. Though temperature protection circuit is built in to protect IC, the maximum power dissipation design within T_j (max) is needed. The thermal protection is independent to each channel.

Thermal Consideration

The power handling capability of the device will be limited by maximum $125^{\circ}C$ operation junction temperature. The power dissipated by the device will be estimated by $P_D = I_{OUT} \times (V_{IN}-V_{OUT})$. The power dissipation should be lower than the maximum power dissipation listed in "Absolute Maximum Ratings" section.

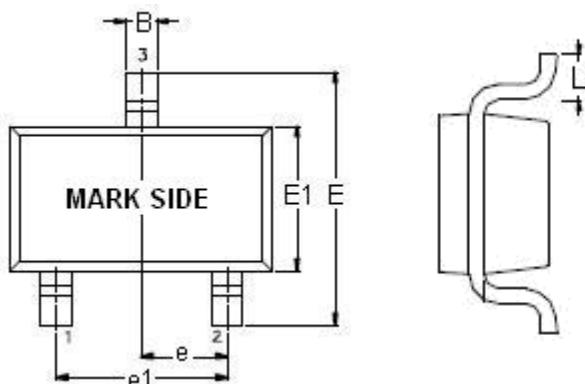

Capacitor Selection

The ceramic capacitor is ideal for FP6141 application. The ESR of the output capacitor affects stability. Larger value of the output capacitor decreases the peak deviations and improves transient response for larger current changes.

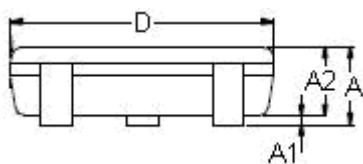

The capacitor types (ceramic, aluminum and tantalum) have different characterizations such as voltage and temperature coefficients. All ceramic capacitors are manufactured with a variety of dielectrics, each with different behavior across temperature and applications. Common dielectrics used are X5R, X7R and Y5V. It is recommended to use $1\mu F$ to $10\mu F$ X5R or X7R dielectric ceramic capacitors, because X5R or X7R hold their capacitance over wider voltage and temperature ranges than other Y5V or Z5U types. The ESR of output capacitor is very important, because it generates a zero to provide phase lead for loop stability. The input capacitor can reduced peak current and noise at power source.
