

LED Driver with Average-Mode Constant Current Control

General Description

The FP7122 is an average current mode control LED driver IC operating in a constant off-time mode. FP7122 does not produce a peak-to-average error, and therefore greatly improves accuracy, line and load regulation of the LED current without any need for loop compensation or high-side current sensing. The output LED current accuracy is $\pm 3\%$.

The FP7122 can be powered from an 8.0 - 100V supply. A PWM & linear dimming input is provided that accepts an external control TTL compatible signal. The output current can be programmed by an internal 250mV reference. or controlled externally through a 0.2 – 1.5V dimming input.

Features

- Fast Average Current Control
- Internal 8 to 100V Linear Regulator
- Linear and PWM Dimming Capability
- Output Short Circuit Protection with Skip Mode
- Requires Few External Components for Operation
- Internal 100V/6A N-MOSFET

Applications

- DC/DC or AC/DC LED Driver Applications
- Back Lighting of Flat Panel Displays
- General Purpose Constant Current Source
- Signage and Decorative LED Lighting
- Chargers

Typical Application Circuit

This datasheet contains new product information. Advanced Analog Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

Marking Information

Halogen Free: Halogen free product indicator

Lot Number: Wafer lot number's last two digits

For Example → Lot : 123456 → XXx-56L

Internal ID: Internal Identification Code

Per-Half Month: Production period indicator in half month time unit

For Example : A → First Half Month of January

B → Second Half Month of January

C → First Half Month of February

D → Second Half Month of February

Year: Production year's last digit

Function Description

Input Voltage Regulator

The FP7122 can be powered directly from its VIN pin and can work from 8.5 - 100VDC at its VIN pin. When a voltage is applied at the VIN pin, the FP7122 maintains a constant 7.5V at the VDD pin. This voltage is used to power the IC and any external resistor dividers needed to control the IC. The VDD pin must be bypassed by a low ESR capacitor to provide a low impedance path for the high frequency current of the internal driver.

The FP7122 can also be operated by supplying a voltage at the VDD pin greater than the internally regulated voltage. This will turn off the internal linear regulator of the IC and the FP7122 will operate directly off the voltage supplied at the VDD pin. Please note that this external voltage at the VDD pin should not exceed 8.5V.

Average Current Control

The LED current is detected using a sense resistor at the CS pin. The feedback operates in a fast open-loop mode. No compensation is required. When the voltage at the DIM input $V_{DIM} \geq 1.5V$, output current is programmed simply as:

$$I_{LED} (A) = \frac{0.25V}{R_{CS} (\Omega)}$$

Otherwise:

$$I_{LED} (A) = \frac{V_{DIM} (V) \times 0.167}{R_{CS} (\Omega)}$$

The above equations are only valid for continuous conduction of the output inductor. It is a good practice to design the inductor such that the switching ripple current in it is 25% of its average peak-to-peak, full load, DC current.

Output Short Circuit Protection

The short circuit protection comparator trips when the voltage at CS exceeds 0.55V. When this occurs, the GATE off-time $T_{HICCUP} = 550\mu s$ is generated to prevent stair-casing of the inductor current and potentially its saturation due to insufficient output voltage.

Linear Dimming

When the voltage at DIM falls below 1.5V, the internal 250mV reference to the constant-current feedback becomes overridden by $V_{DIM} \cdot 0.185$. As long as the current in the inductor remains continuous, the LED current is given by the equation above. However, when V_{DIM} falls below 200mV, the internal MOSFET output becomes disabled. The internal MOSFET signal recovers, when V_{DIM} exceeds 250mV. This is required in some applications to be able to shut the LED lamp off with the same signal input that controls the brightness.

PWM Dimming

Due to the fast open-loop response of the average-current control loop of the FP7122, its PWM dimming performance nearly matches that of the FP7171.

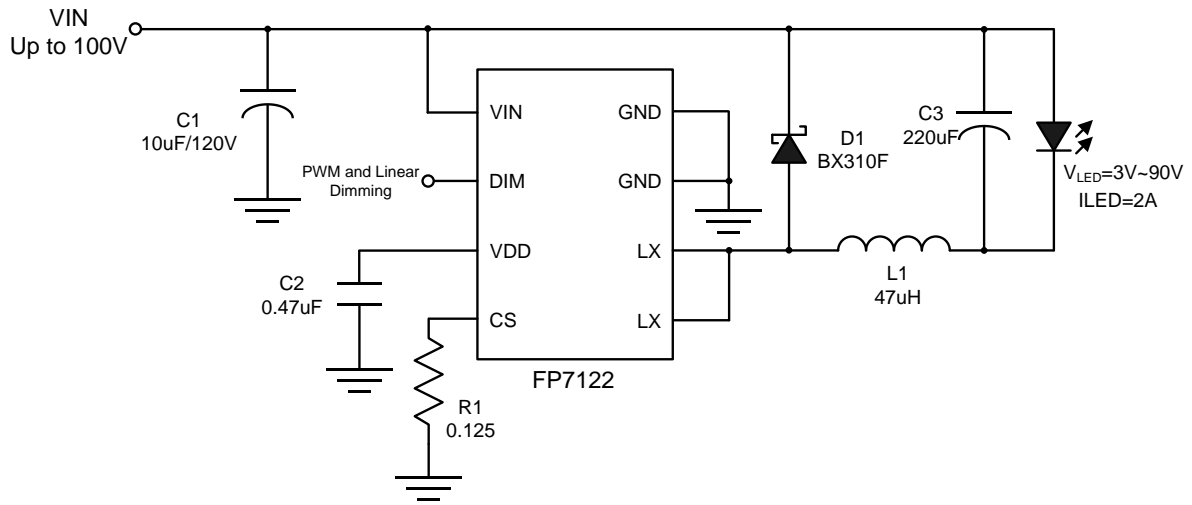

The rising and falling edges are limited by the current slew rate in the inductor. The first switching cycle is terminated upon reaching the 250mV ($V_{DIM} \cdot 0.167$) level at CS. The circuit is further reaching its steady-state within 1 switching cycles regardless of the switching frequency.

Package Outline

SOP-8L (EP)

UNIT: mm

Symbols	Min. (mm)	Max. (mm)
A	1.30	1.70
A1	0	0.15
A2	1.25	1.55
D	4.70	5.10
E	3.80	4.00
H	5.80	6.20
L	0.40	1.27

Exposed PAD Dimensions:

Symbols	Min. (mm)	Max. (mm)
D1	2.60	3.45
E1	1.90	2.56

Note:

1. Package dimensions are in compliance with JEDEC outline: MS-012 AA.
2. Dimension "D" does not include molding flash, protrusions or gate burrs.
3. Dimension "E" does not include inter-lead flash or protrusions.
