

## Non-Synchronous PWM Boost Controller for LED Driver

### General Description

The FP7209 is boost topology switching regulator for LED driver. It provides built-in gate driver pin for driving external N-MOSFET. The non-inverting input of error amplifier connects to a 0.25V reference voltage. It has programmable soft start time and switching frequency set by external capacitor and resistor. There are four functions to protect system circuit, such as UVP, OVP, SCP and OCP. The LED current can be adjusted by an external signal connecting to the DIM pin. DIM pin accepts either a DC voltage or a PWM signal. The PWM signal filter components are contained within the chip. Current mode control and external compensation network make is easy and flexible to stabilize the system.

The FP7209 is available in the small footprint SOP-8L(EP) and TSSOP-14L(EP) packages to fit in space-saving PCB layout for application fields.

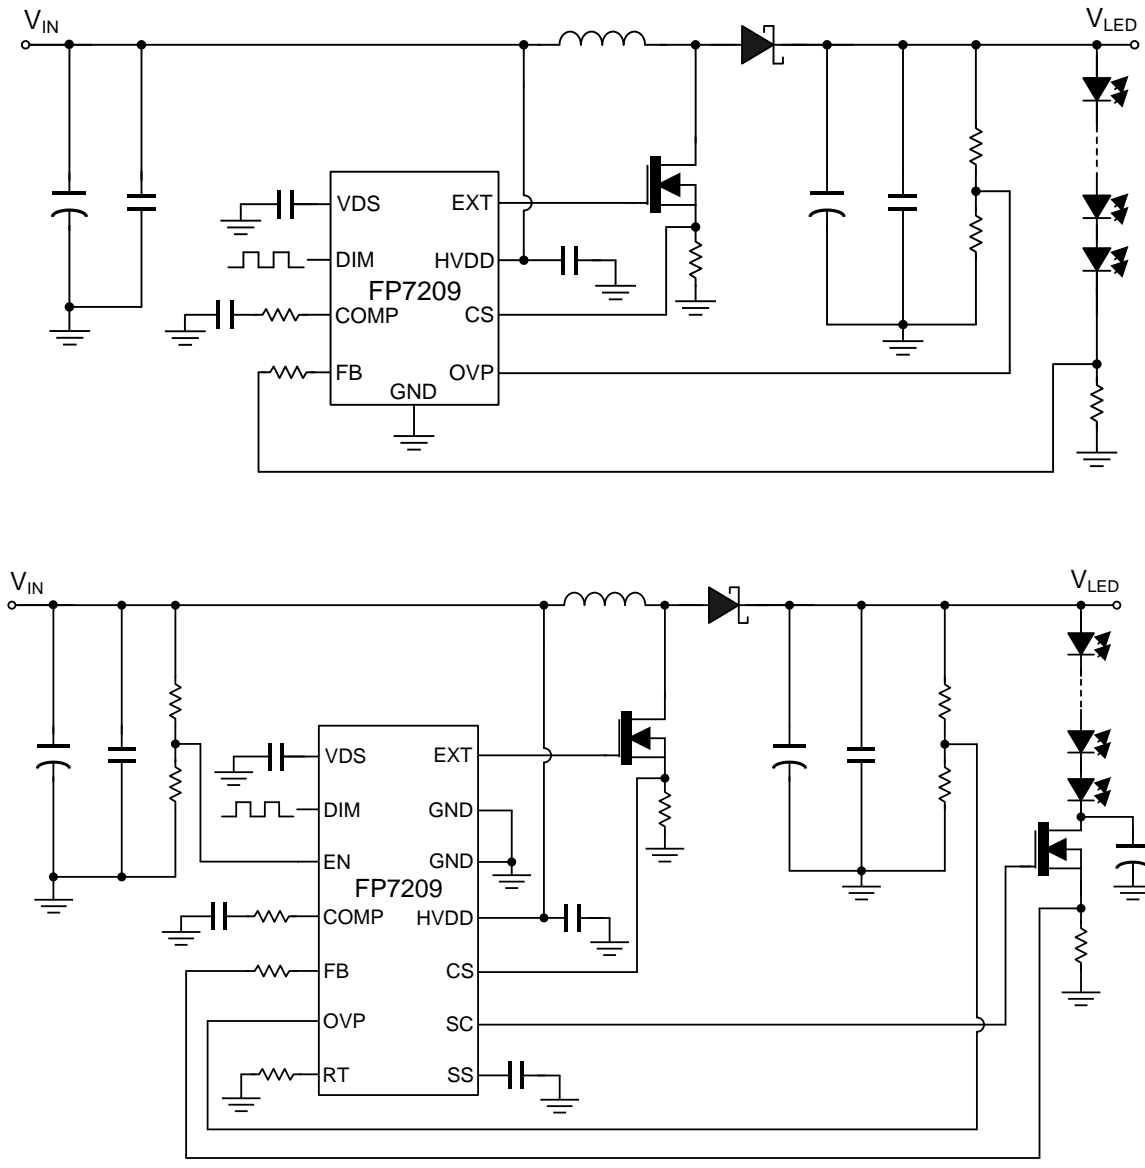

### Features

- Start-up Voltage: 2.8V
- Wide Supply Voltage Operating Range: 5V to 24V
- Precision Feedback Reference Voltage: 0.25V (Max.)
- Analog and Digital Dimming Control
- Shutdown Current: 6 $\mu$ A (Max.) / TSSOP-14L(EP)
- Programmable Switching Frequency: 100KHz~1000KHz
- Programmable Soft Start Function (SS)
- Input Under Voltage Protection (UVP)
- Output Over Voltage Protection (OVP)
- LED Short Circuit Protection (SCP)
- Switching MOSFET Over Current Protection (OCP)
- Over Temperature Protection (OTP)
- Package: SOP-8L(EP), TSSOP-14L(EP)

### Applications

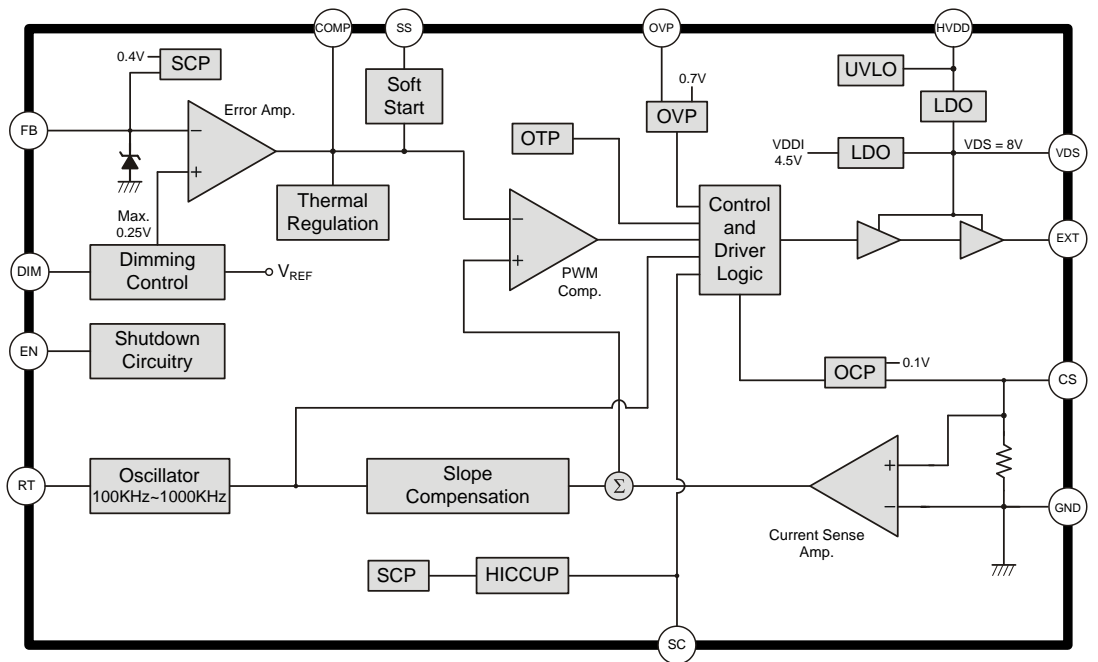

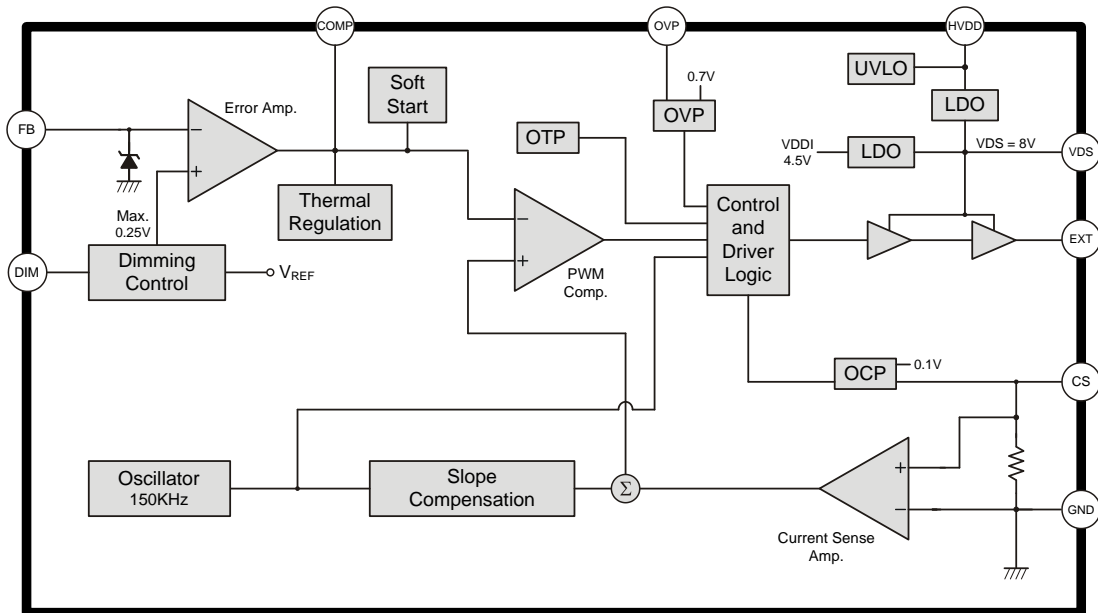

- LED Module
- Display Backlight
- Car Lighting
- Portable LED Lighting

### Typical Application Circuit

This datasheet contains new product information. Advanced Analog Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

### Function Block Diagram

## Pin Descriptions

### SOP-8L(EP)

Name	No.	I / O	Description
VDS	1	P	Power Supply for Internal Control Circuits and Gate Drivers
DIM	2	I	Analog and Digital Dimming Control
COMP	3	O	Compensation
FB	4	I	Error Amplifier Inverting Input
OVP	5	I	Over Voltage Protection
CS	6	I	MOSFET Switch Current Sense
HVDD	7	P	IC Power Supply
EXT	8	O	Gate Driver Output
GND	9(EP)	P	IC Ground (Exposed PAD) – Must Connect to Ground

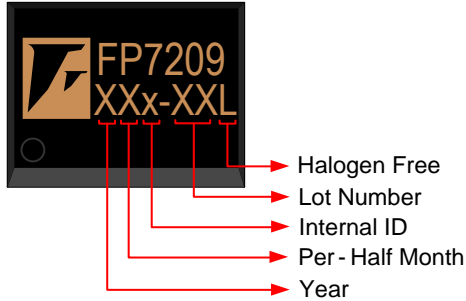

### TSSOP-14L(EP)

Name	No.	I / O	Description
VDS	1	P	Power Supply for Internal Control Circuits and Gate Drivers
DIM	2	I	Analog and Digital Dimming Control
EN	3	I	Enable Control
COMP	4	O	Compensation
FB	5	I	Error Amplifier Inverting Input
OVP	6	I	Over Voltage Protection
RT	7	I	Frequency Programming
SS	8	I	Soft Start Programming
SC	9	O	LED Short Circuit Control
CS	10	I	MOSFET Switch Current Sense
HVDD	11	P	IC Power Supply
GND	12	P	IC Ground
GND	13	P	IC Ground
EXT	14	O	Gate Driver Output
EP	15	-	Exposed PAD Connect to Ground

## Marking Information

### SOP-8L(EP)

### TSSOP-14L(EP)

**Halogen Free:** Halogen free product indicator

**Lot Number:** Wafer lot number's last two digits

For Example → Lot : 123456 → XXx-56L

**Internal ID:** Internal Identification Code

**Per-Half Month:** Production period indicator in half month time unit

- For Example :
- A → First Half Month of January
  - B → Second Half Month of January
  - C → First Half Month of February
  - D → Second Half Month of February

**Year:** Production year's last digit

## Ordering Information

Part Number	Operating Temperature	Package	MOQ	Description

## Function Description

### Operation

The FP7209 is current mode boost controller for LED driver, which provides fast transient response; external compensation network is easy and flexible to stabilize the system. FP7209 features a constant frequency, peak current mode control with slope compensation. The internal resistive divider provides 0.25V reference for the error amplifier, low reference voltage can reduce the power dissipation in the current sense resistor. To control DIM pin can achieve PWM and analog dimming of LED current.

### Current Sense Control

External switching MOSFET is turned on inductor current flows across the current sense resistor to generate  $V_{CS}$ .  $V_{CS}$  provides part of current mode control loop. Internal leading-edge blanking is provided to prevent premature turn off the switching MOSFET in each switching cycle.

### Current Limit Setting Resistor ( $R_{CS}$ )

$R_{CS}$  is connected between CS pin and ground, its calculation formula is as below. Where 0.085V is minimum threshold voltage of current sense,  $I_{Lp}$  is peak inductor current, and the factor 1.3 provides a 30% margin for tolerances.

According to following equations calculate the peak inductor current  $I_{Lp}$ . Where  $I_{Lavg}$  is the average inductor current,  $I_{Lpp}$  is the peak-to-peak inductor current,  $V_{out}$  is the LED voltage,  $I_{out(max)}$  is the LED maximum current,  $Eff$  is the efficiency,  $F_s$  is the switching frequency, and the  $L$  is inductance.

$$I_{Lp} = I_{Lavg} + \frac{I_{Lpp}}{2}$$

$$I_{Lavg} = \frac{V_{out} \times I_{out(max)}}{V_{in} \times Eff}$$

$$I_{Lpp} = \left\langle \frac{V_{in}}{V_{out}} \right\rangle^2 \times \left\langle \frac{V_{out} - V_{in}}{F_s \times I_{out(max)}} \right\rangle \times \left\langle \frac{Eff}{L} \right\rangle \times I_{Lavg}$$

### Soft Start Function

Soft start time is programmable to connect capacitor between SS pin to ground. After the IC is enabled, the output of error amplifier is clamped by the internal soft-start function, which causes PWM pulse width increasing slowly and thus reducing input surge current during power on. The soft start bias current is 3.5µA.

### Oscillator

The oscillator frequency can be set from 100KHz to 1000KHz by external resistance. Acceptable resistance values range from 220KΩ to 17KΩ. The frequency is 150KHz when the resistance is unconnected. The relationship between the timing resistance RT and frequency is shown in Figure1. The oscillator frequency can be calculated using formula below.

$$RT(K\Omega) = \frac{17000}{f_{OSC}(KHz) - 25}$$

Figure 1. Frequency vs. RT Resistance

### Enable Mode / Shutdown Mode

Input voltage connects to EN pin through a resistive divider to set UVLO threshold. FP7209 is enabled when EN voltage greater than 1.5V. The EN voltage is lower than 1.3V to shutdown it. In shutdown mode, to turn off circuitry includes EXT signal, VDS voltage, SC signal, and supply current of HVDD reduces less than 6µA. The EN hysteresis voltage is 0.2V. FP7209 also goes into shutdown

This datasheet contains new product information. Advanced Analog Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

mode when DIM voltage is lower than 0.05V. HVDD voltage may be lower than 5V, it can't use a resistive divider to set UVLO threshold. For instance, input voltage is from 3V to 4.2V, HVDD pin connects to output 12V, when UVLO is triggered to shut down FP7209, HVDD and output are approximately input voltage. If the applications don't need to set UVLO, the EN connects to input voltage through resistance 200KΩ.

### DC Dimming Control

The DC voltage is connected to DIM pin change the voltage to adjust feedback voltage ( $V_{FB}$ ). The valid range of DIM voltage is from 0.275V to 2.7V then  $V_{FB}$  is adjusted from 7.5mV to 250mV. The DIM has clamping circuit to limit internal maximum voltage in 2.7V.  $V_{FB}$  is still 0.25V even if DIM voltage exceeds 2.7V. The LED current ( $I_{LED}$ ) is calculated using formula as below.

$$V_{FB} = \frac{V_{DIM} - 0.2V}{10}, \quad I_{LED} = \frac{V_{FB}}{R_S}$$

### PWM Dimming Control

The PWM signal is connected to DIM pin changes PWM duty cycle to adjust feedback voltage ( $V_{FB}$ ). The valid range of PWM duty from 10.2% to 100% then  $V_{FB}$  is adjusted from 7.5mV to 250mV. The DIM has clamping circuit to limit internal maximum voltage in 2.7V. If dimming PWM voltage exceeds 2.7V,  $V_{PWM}$  uses 2.7V to calculate the  $V_{FB}$ . The PWM frequency is recommended above 15KHz. The LED current ( $I_{LED}$ ) is calculated using formula as below.

$$V_{FB} = \frac{V_{PWM} \times \text{Duty} - 0.2V}{10}, \quad I_{LED} = \frac{V_{FB}}{R_S}$$

### FB Voltage Setting

The DIM connects to input voltage through resistance 200kΩ when applications don't need to Dimming control. The FB voltage fixes in 0.25V. The DIM pin can't float in normal operation.

### Over Voltage Protection

Use a resistive divider between LED+ and OVP pin to set overvoltage threshold limit. The EXT signal is always turned off when OVP is greater than 0.7V. OVP is lower than 0.7V then EXT signal is turned on immediately, the hysteresis voltage doesn't exist. The voltage ( $V_{OVP}$ ) can be calculated using following formula.

$$V_{OVP} = 0.7V \times \left( 1 + \frac{R11}{R12} \right)$$

### LED Short Protection

If LED string is shorted, this causes high peak current flows across to current sense resistor Rs. The Rs is connected between FB pin and ground. When FB exceeds 0.4V for more than 1μs, SC pulls down to turn off MOSFET Q3 and rest for 700μs. EXT signal is also turned off. FP7209 goes into the hiccup mode. Short path of LED is removed then IC recovers from hiccup mode. The SC of hiccup waveform is shown as below. When LED string is shorted, Q3's drain point produces high surge voltage. C14 electrolytic capacitor connects from Q3's drain to ground to suppress surge voltage, it can avoid Q3 damage. Electrolytic capacitor 1μF is recommended, and circuitry is as below.

### Thermal Shutdown Protection

The IC will shut down automatically when the internal junction temperature exceeds +150°C. The device can restart until the junction temperature drops below +120°C approximately.

## Application Information

### Inductor Selection

The Inductance value is decided based on different condition. 4.7 $\mu$ H to 68 $\mu$ H inductance value is recommended for general application circuit. There are three important inductor specifications, DC resistance, saturation current and core loss. Low DC resistance has better power efficiency. The inductance is calculated using formula. Where  $V_{out}$  is LED string voltage,  $F_s$  is switching frequency,  $I_{out}$  is LED maximum current,  $Eff$  is boost efficiency and  $r$  is the ratio of the inductor peak-to-peak ripple current to the average DC inductor current at full load current.  $r$  is recommended between 0.3 and 0.5.

$$L = \left\langle \frac{V_{in}}{V_{out}} \right\rangle^2 \times \left\langle \frac{V_{out} - V_{in}}{F_s \times I_{out(max)}} \right\rangle \times \left\langle \frac{Eff}{r} \right\rangle$$

### Capacitor Selection

The output capacitor is required to maintain the DC voltage during switching. Low ESR capacitors are preferred to reduce the output voltage ripple. Ceramic capacitor of X5R and X7R are recommended, which have low equivalent series resistance (ESR) and wider operation temperature range.

### Diode Selection

Schottky diodes with fast recovery times and low forward voltages are recommended. Ensure the diode average and peak current rating exceed the average output current and peak inductor current. In addition, the diode's reverse breakdown voltage must exceed the output voltage.

### LED Current Programming

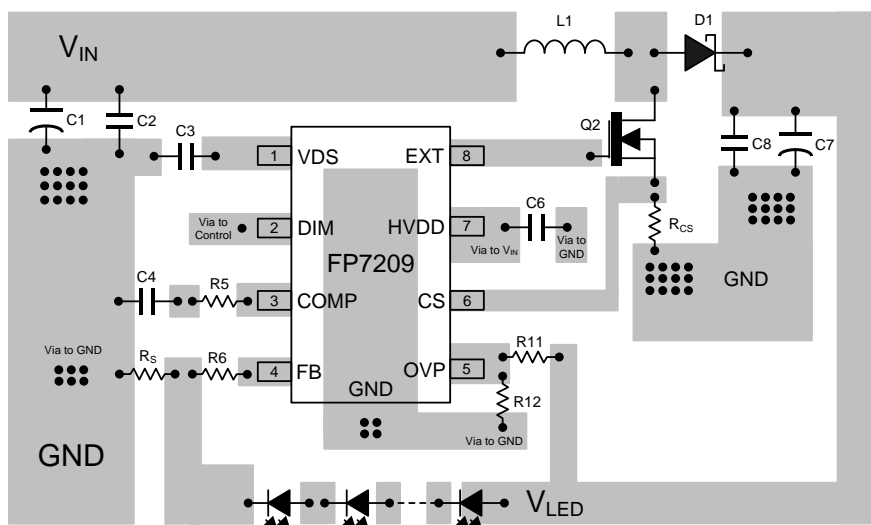

The LED current is set by a resistor from the FB pin to ground. The LED current is:

$$I_{LED} = \frac{V_{FB}}{R_S}$$

### Layout Considerations

1. The power traces, consisting of the GND trace, the Q2 MOS drain trace and the  $V_{IN}$  trace should be kept short, direct and wide.
2. Layout switching node Q2 MOS drain, inductor and schottky diode connection traces wide and short to reduce EMI.

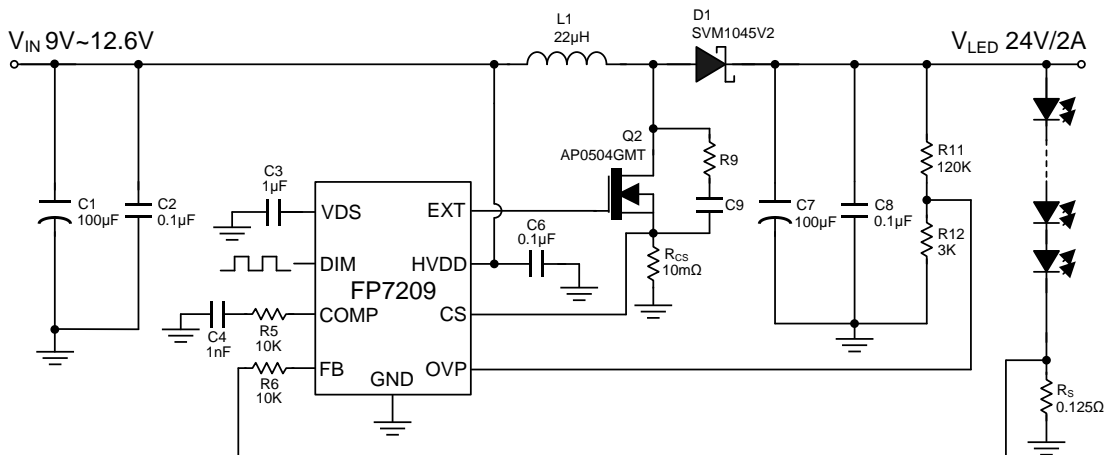

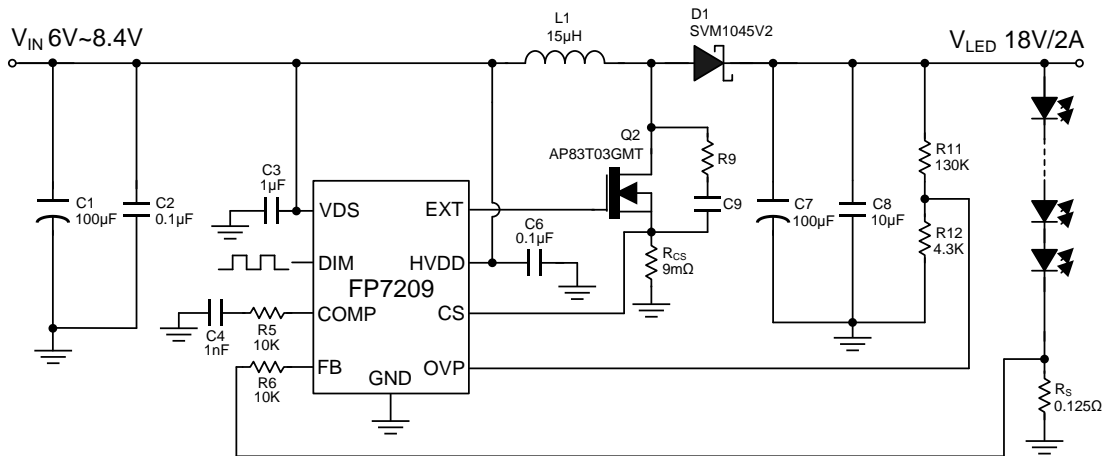

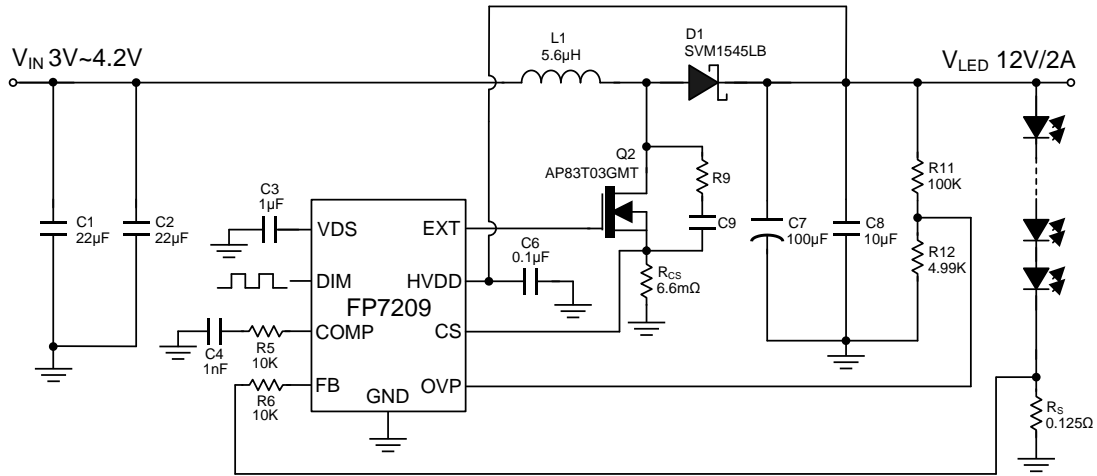

3. Place C6 nearby HVDD as closely as possible to maintain input voltage steady and filter noise.
4. The sense resistor  $R_s$  must be connected to FB pin directly and as closely as possible.
5. FB is a sensitive node. Please keep it away from switching node, Q2 MOS drain.
6. R11 and R12 must be connected close to OVP and GND pin.
7.  $R_{CS}$  must be connected close to CS and GND pin.
8. Output capacitor C7/C8 should be connected close and together directly to the ground of  $R_{CS}$ .
9. The GND of the  $R_{CS}$ , C1, C2, C7 and C8 should be connected close and together directly to a ground plane.

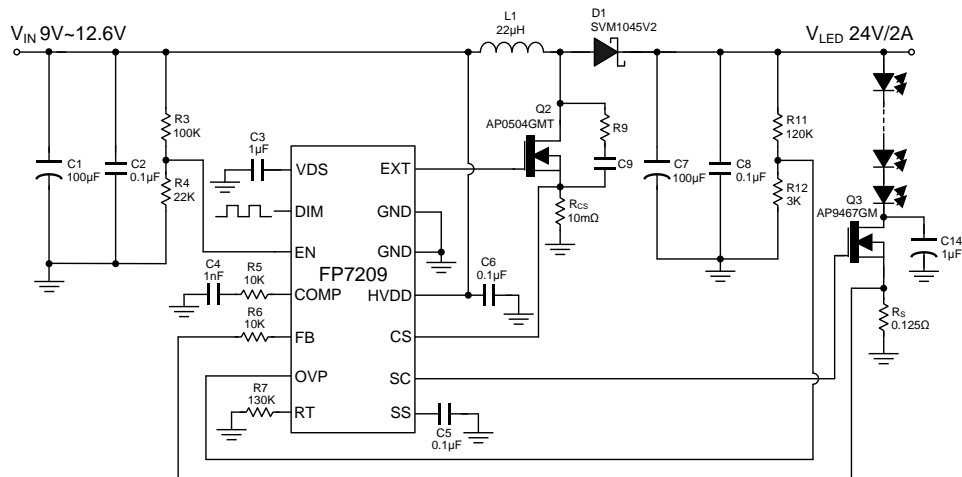

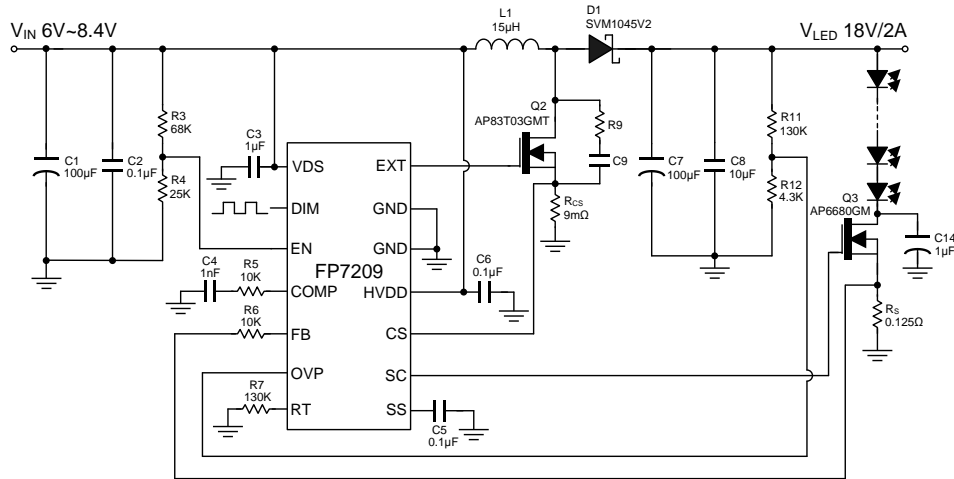

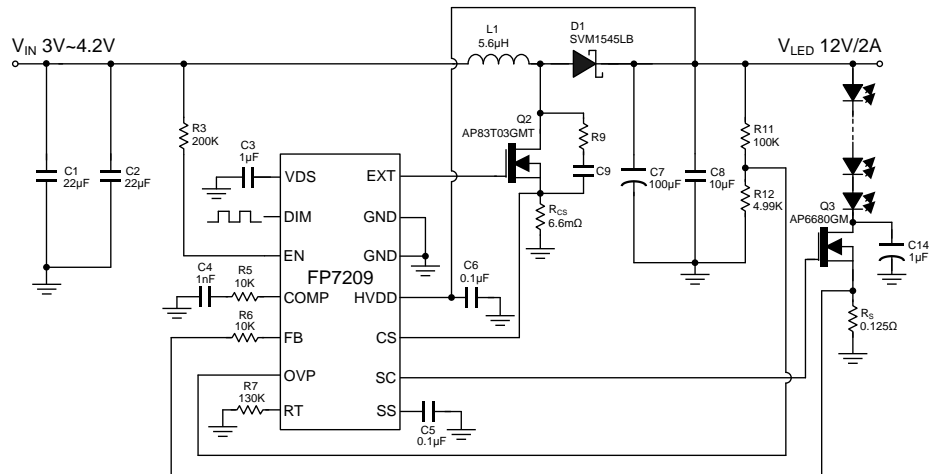

### Suggested Layout

This datasheet contains new product information. Advanced Analog Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

## Typical Application

This datasheet contains new product information. Advanced Analog Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

**Note:**

1. The X5R and X7R of ceramic capacitors are recommended to choose.
2. R9 and C9 are added for reducing EMI (Electromagnetic Interference).
3. Vin is from 3V to 4.2V, it can't use a resistive divider R3/R4 to set UVLO threshold.

This datasheet contains new product information. Advanced Analog Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

## Package Outline

### SOP-8L (EP)

UNIT: mm

Symbols	Min. (mm)	Max. (mm)
A	1.30	1.70
A1	0	0.15
A2	1.25	1.55
D	4.70	5.10
E	3.80	4.00
H	5.80	6.20
L	0.40	1.27

#### Exposed PAD Dimensions:

Symbols	Min. (mm)	Max. (mm)
D1	2.60	3.45
E1	1.90	2.56

#### Note:

1. Package dimensions are in compliance with JEDEC outline: MS-012 AA.
2. Dimension "D" does not include molding flash, protrusions or gate burrs.
3. Dimension "E" does not include inter-lead flash or protrusions.

TSSOP-14L(EP)

UNIT: mm

Symbols	Min. (mm)	Nom.(mm)	Max. (mm)
