

## 16V 3A Multi-Cell Battery Switching Charger

### General Description

The FP8207 is a 4.9V~16V input voltage, 3A multi cell synchronous step-down switching charger with few external components, FP8207 is well suited for a wide range of portable applications. Charging current can be programmed by an external current sensing resistor. With 500KHz switching frequency. The FP8207 employs a 2.4V float voltage feedback reference, so any desired battery float voltage up to 12.6V can be programmed with a resistor divider. Other features include UVLO, automatic recharge, charge status indicators and battery temperature monitor.

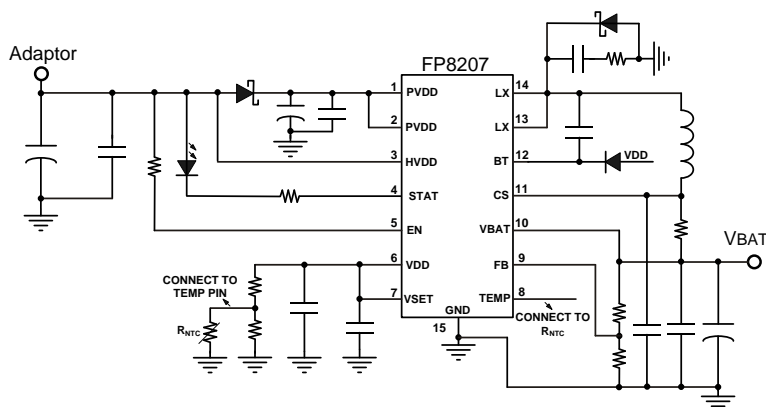

### Features

- Wide Input Voltage Range: 4.9V to 16V
- Up to 3A Programmable Charge Current
- Resistor Programmable Battery Float Voltage Range: 4.1V to 12.6V
- Preset Charge Voltage with  $\pm 1\%$  Accuracy
- Automatic Recharge
- Fix 500KHz Switching Frequency
- Support 94% Duty Cycle
- Thermal Regulation
- Charge Status Indicators for No Battery and Charge Failure Display
- Available TSSOP-14L With Exposed PAD

### Applications

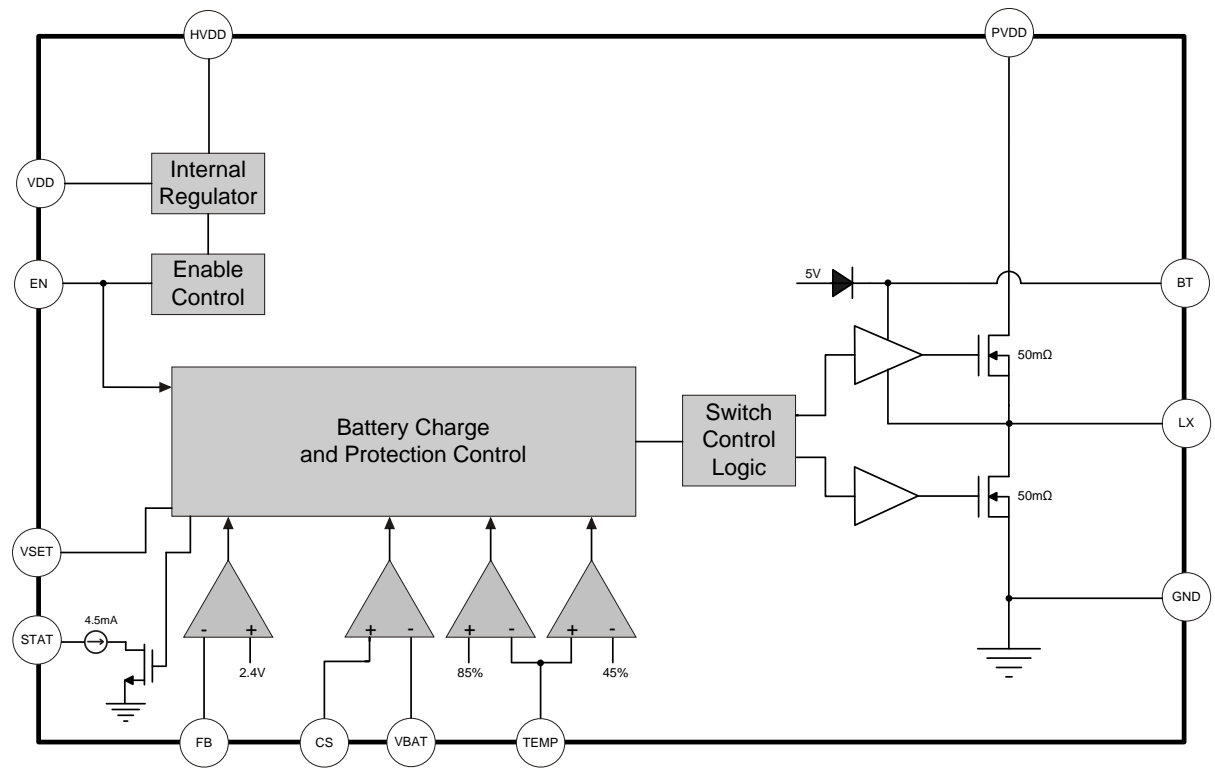

- Portable Information Appliances
- Charging Docks & Cradles
- Solar Powered Applications
- Handheld Computers

### Typical Application Circuit

This datasheet contains new product information. Advanced Analog Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

## Pin Descriptions

### TSSOP-14L(EP)

Name	No.	I / O	Description
PVDD	1	I	Adaptor Input Voltage
PVDD	2	I	Adaptor Input Voltage
HVDD	3	P	Adaptor Input Voltage for IC Control
STAT	4	O	Charge State Indicator, 4.5mA LED current
EN	5	I	Chip Enable Control
VDD	6	O	5V LDO output( $V_{IN} > 7V$ ), drive up to 1mA
VSET	7	I	Charge current regulation
TEMP	8	I	Battery Temperature Detector
FB	9	I	Battery Float Voltage Feedback Reference
VBAT	10	P	Battery Voltage
CS	11	I	Charge current-sense input
BT	12	O	Bootstrap
LX	13	O	Switch node and inductor connection pin
LX	14	O	Switch node and inductor connection pin
EP	15	P	IC Ground . Exposed PAD-Must connect to Ground

## Marking Information

### TSSOP-14L(EP)

**Halogen Free:** Halogen free product indicator

**Lot Number:** Wafer lot number's last two digits

For Example → Lot : 123456 → XXx-56L

**Internal ID:** Internal Identification Code

**Per-Half Month:** Production period indicator in half month time unit

For Example : A → First Half Month of January  
B → Second Half Month of January  
C → First Half Month of February  
D → Second Half Month of February

**Year:** Production year's last digit

## Ordering Information

Part Number	Operating Temperature	Package	MOQ	Description
FP8207mR-G1	-25°C ~ +85°C	TSSOP-14L(EP)	2500EA	Tape & Reel

## Absolute Maximum Ratings

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit

## Function Description

### Operation

The FP8207 is a switch-mode battery charger designed primarily for charging multi cell lithium-ion batteries. The charger uses a constant-current/constant-voltage charge algorithm with programmable current. Charging current can be programmed externally with a single current sensing resistor between the CS pin and the BAT pin.

### Normal Charge Cycle

A charge cycle begins when the voltage at the  $H_{VDD}$  pin rises above the UVLO threshold. If the BAT pin voltage is smaller than  $68\% \cdot V_{FLOAT}$ , the charger enters trickle charge mode. In this mode, the FP8207 supplies approximately 1/10 the programmed charging current to bring the battery voltage up to a safe level for full current charging. When the BAT pin voltage rises over  $68\% \cdot V_{FLOAT}$ , the charger enters constant-current mode, where the full programmed charge current is supplied to the battery. When the BAT pin voltage approaches  $98.5\% \cdot V_{FLOAT}$ , the FP8207 enters the constant-voltage mode and the charge current begins to decrease. When the charge current drops to 1/10 of the programmed value, the charge cycle ends.

### Setting Charge Current

When the battery voltage exceeds the trickle charge threshold, the charger goes into the full scale constant current charge mode. In constant current mode, the charge current is set by the external sense resistor  $R_{CS}$  and an internal 50mV reference. The required resistor value can be calculated from the charge current with following equation:

$$R_{CS} = \frac{50\text{mV}}{I_{CHG}}$$

### Charge Termination

A charge cycle is terminated when the charge current falls to 1/10 the programmed value after the final float voltage is reached. This condition is detected by using an internal filtered comparator to monitor the sense voltage. When the voltage between the CS pin and the BAT pin falls below 5mV for longer than  $T_{TERM}$  (1.8ms), charging is terminated. The charge current is latched off and the FP8207 enters standby mode, where the input supply current drops to 200uA. The FP8207 draws very few current from the battery in standby mode. This feature reduces the charge and discharge cycles on the battery, further prolonging the battery life.

## Thermal Protection and Thermal Fold-back Protection

The thermal fold-back protection will reduce the charge current if the IC junction temperature is higher than 125°C.

The over temperature protection will shut down the charger when the IC junction temperature is higher than 150°C.

## Programming Battery Float Voltage

The output battery float voltage is programmed by connecting a resistor divider from the BAT pin to FB pin. The battery float voltage can be programmed up to 12.6V. The battery float voltage value can be calculated by following equation:

$$V_{\text{FLOAT}} = 2.4 \times \frac{R_1 + R_2}{R_2}$$

	R1	R2
One Cell	270kΩ	360 kΩ
Two Cells	750kΩ	300kΩ
Three Cells	680kΩ	160kΩ

## Battery Temperature Fault Monitoring

In the event of a battery over-temperature condition, the charging control will turn off the internal pass device and report a battery temperature fault on the TEMP pin. Inside the FP8207, two internal voltage references  $V_{\text{TEMP-H}}$  and  $V_{\text{TEMP-L}}$  are fixed at  $80\% \times V_{\text{DD}}$  and  $45\% \times V_{\text{DD}}$  respectively. As the TEMP pin voltage rises above  $V_{\text{TEMP-H}}$  or falls below  $V_{\text{TEMP-L}}$ , the FP8207 stops charging and indicates a fault condition. After the system recovers from a temperature fault, the device will resume charging operation. For applications that do not need to monitor the battery temperature, short the TEMP pin to the GND.

The values of R1 and R2 are set according to the battery temperature range and the value of thermal sensitive resistor. If the battery is equipped with NTC(Negative Temperature Coefficient) thermistor and the temperature monitor range is  $T_L \sim T_H (T_L < T_H)$ , then  $R_T$ , the thermistor resistance,

---

This datasheet contains new product information. Advanced Analog Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

decreases as temperature increases from  $T_L$  to  $T_H$ , means  $R_{TL} > R_{TH}$ .

The TEMP pin voltage can be calculated as:

$$V_{TEMP} = \frac{R2 // R_T}{R1 + R2 // R_T} \times V_{CC}$$

Thus, this  $V_{TEMP}$  decreases as the temperature increase from  $T_L$  to  $T_H$ .

To set proper R1 and R2 value for temperature protection, we set:

$$0.8 \times V_{DD} = V_{TEMPH} = \frac{R2 // R_{TL}}{R1 + R2 // R_{TL}} \times V_{CC} \text{ at } T_L$$

$$0.45 \times V_{DD} = V_{TEMPL} = \frac{R2 // R_{TH}}{R1 + R2 // R_{TH}} \times V_{CC} \text{ at } T_H$$

Where  $R_{TL}$  and  $R_{TH}$  are the thermistor resistances at  $T_L$  and  $T_H$  respectively.

So R1 and R2 can be derived as following:

$$R1 = \frac{R_{TL}R_{TH}(K_2 - K_1)}{(R_{TL} - R_{TH})K_1K_2} = \frac{R_{TL}R_{TH} \times 35}{(R_{TL} - R_{TH}) \times 36}$$

$$R2 = \frac{R_{TL}R_{TH}(K_2 - K_1)}{R_{TL}(K_1 - K_1K_2) - R_{TH}(K_2 - K_1K_2)} = \frac{R_{TL}R_{TH} \times 35}{R_{TL} \times 9 - R_{TH} \times 44}$$

where  $K_1 = 0.45$  and  $K_2 = 0.8$

## Input Supply Voltage Regulation

The FP8207 contains a voltage monitor pin that enables programming a minimum operational voltage. Connecting a resistor divider from IN pin to the EN<sub>REG</sub> pin enables programming of minimum input supply voltage, typically used to program the peak power voltage for a solar panel. Maximum charge current is reduced when the EN<sub>REG</sub> pin is below the regulation threshold of 2.4V. If an input supply cannot provide enough power to satisfy the requirements of an FP8207 charger, the supply voltage will collapse. A minimum operating supply voltage can thus be programmed by monitoring the supply through a resistor divider, such that the desired minimum voltage corresponds to 2.4V at the EN<sub>REG</sub> pin. The FP8207 serves the maximum output charge current to maintain the voltage on EN<sub>REG</sub> at or above 2.4V.

Programming of the desired minimum voltage is accomplished by connecting a resistor divider. It can be calculated by following equation:

$$\frac{R1}{R2} = \frac{VIN(min)}{2.4} - 1$$

(EN Pin Voltage must be under 5.5V)

If the voltage regulation feature is not used, connect a resistor 300kΩ between EN<sub>REG</sub> pin and VIN.

This datasheet contains new product information. Advanced Analog Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

## Charge Current Regulation

The full-scale differential voltage between CS and VBAT pins is 50mV. Battery charge current is sensed by resistor  $R_{\text{sense}}$  connected between CS and VBAT. VSET pins could be used of charge current regulation and the equation is as following:

$$I_{\text{CHG}} = \frac{50\text{mV}}{R_{\text{cs}}} \times \frac{\text{VSET}}{1.2\text{V}} \quad (0.6\text{V} \leq \text{VSET} \leq 1.2\text{V})$$

※ It is recommended to use this function in Constant-Current Charge Mode.

$$I_{\text{CHG}} = \frac{50\text{mV}}{R_{\text{cs}}} \quad (\text{VSET} \geq 1.2\text{V})$$

If VSET under 0.2V, the charge cycle ends.

## Manual Shutdown

At any point in the charge cycle, the FP8207 can be put into shutdown mode when put the EN pin to the low-level voltage. This reduces the battery drain current to about to 13uA and the supply current to less than 10uA.

## Under Voltage Lockout (UVLO)

An internal under voltage lockout circuit monitors the input voltage and keeps the charger in shutdown mode until  $V_{\text{IN}}$  rises above the under voltage lockout threshold. The UVLO circuit has a built-in hysteresis of 200mV. Furthermore, to protect against reverse current in the power MOSFET, the UVLO circuit keeps the charge in shutdown mode if  $V_{\text{IN}}$  falls to within 70mV of the battery voltage, If the UVLO comparator is tripped, the charger will not come out of shutdown mode until  $V_{\text{IN}}$  rises 200mV above the battery voltage.

## Automatic Recharge

Once the charge cycle is terminated, the FP8207 continuously monitors the voltage on the BAT pin using a comparator with a 1.8ms filter time ( $T_{\text{RECHARGE}}$ ). A charge cycle restarts when the battery voltage falls below  $95\% \cdot V_{\text{FLOAT}}$  (which corresponds to approximately 80% to 90% battery capacity). This ensures that the battery is kept at or near a fully charged condition and eliminated the need for periodic charge cycle initiations. STAT output enters a strong pull-down state during recharge cycles.

---

This datasheet contains new product information. Advanced Analog Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

## Application Information

### Board Layout Considerations

It is very important to apply a good thermal conduction PC board layout to maximize the available charge current. The thermal path for the heat generated by the IC is from the die through the package leads (especially the ground lead) to the PC board copper. The PC board copper is the heat sink. The copper pads footprint should be as large as possible and expand out to large copper areas to spread and dissipate the heat to the surrounding ambient. Feed-through vias to inner or backside copper layers are also useful in improving the overall thermal performance of the charger. Other heat source on the board, not related to the charger, must also be considered when designing a PC board layout because they will affect overall temperature rise and the maximum charge current.

### Inductor Selection

Inductance value is decided based on different conditions. 3.3 $\mu$ H to 4.7 $\mu$ H inductance value is recommended for general application circuit. There are three important inductor specifications, DC resistance, saturation current and core loss. Low DC resistance has better power efficiency.

### Capacitor Selection

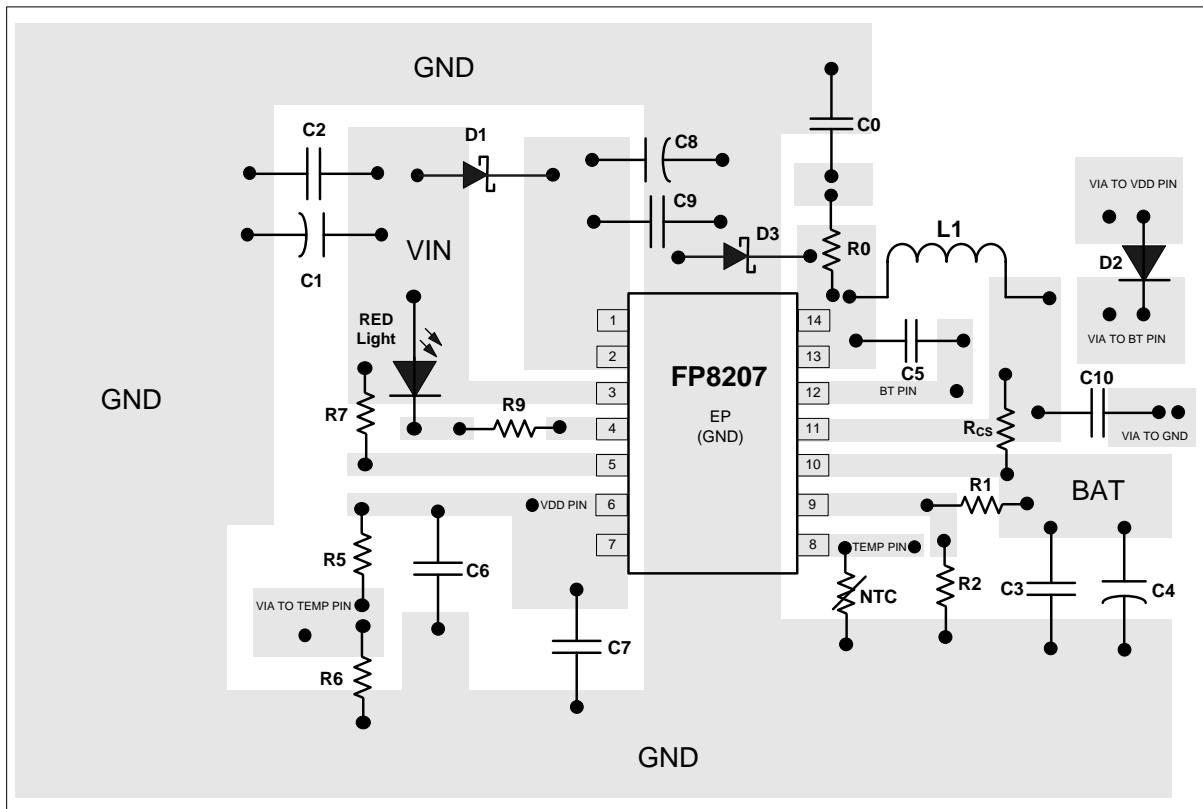

Use Low ESR electrolytic capacitor is preferred to reduce the input inrush voltage, the other ceramic capacitors of X5R and X7R are recommended, which have low equivalent series resistance (ESR) and wider operation temperature range.

### Layout Considerations

1. The power traces, consisting of the GND trace, the LX trace and the battery trace should be kept short, direct and wide.
2. Layout switching node LX, BT and inductor connection traces wide and short to reduce EMI.
3. Place input capacitor C1, C2, C8, C9 nearby Power pin as closely as possible to maintain input voltage steady and filter out the pulsing input current.
4. The GND of the C<sub>IN</sub> should be connected close together and directly to a ground plane.
5. Place R<sub>CS</sub> nearby BAT pin and CS pin.
