# 16-Bit to 32-Bit Multiplexer/ Demultiplexer Bus Switch with -2 V Undershoot Protection

# FSTU32160

### **General Description**

The ON Semiconductor Switch FSTU32160 is a 16–bit to 32–bit highspeed CMOS TTL–compatible multiplexer/demultiplexer bus switch. The low on resistance of the switch allows inputs to be connected to outputs without adding propagation delay or generating additional ground bounce noise.

The device can be used in applications where two buses need to be addressed simultaneously. The FSTU32160 is designed so that the A Port demultiplexes into  $B_1$  or  $B_2$  or both. The A and B Ports have "undershoot hardened" circuit protection to support an extended range to 2.0 V below ground. The integrated Undershoot Hardened Circuit senses undershoot at the I/O's, and responds by preventing voltage differentials from developing and turning on the switch.

Two select  $(S_1, S_2)$  inputs provide switch enable control. When  $S_1$ ,  $S_2$  are HIGH, the device precharges the B Port to a selectable bias voltage (Bias V) to minimize live insertion noise.

### Features

- Undershoot hardened to -2 V (A and B Ports)
- Slower Output Enable Times prevent Signal Disruption

- Minimal Propagation Delay through the Switch
- Low I<sub>CC</sub>
- Zero Bounce in Flow-through Mode
- Control Inputs Compatible with TTL Level
- See Application Note AN-5008 for Details
- This Device is Pb–Free and is RoHS Compliant

Typical values are at V<sub>CC</sub> = 5.0 V and T<sub>A</sub> = +25°C
Measured by the voltage drop between A and B pins at the indicated current through the switch. On resistance is determined by the lower of the voltages on the two (A or B) pins.

6. This parameter is guaranteed by design but is not tested. The bus switch contributes no propagation delay other than the RC delay of the typical On resistance of the switch and the 50 pF load capacitance, when driven by an ideal voltage source (zero output impedance).
