Product Description

FTM-8012C-S/FTM-8012C-L is fully compliant with SFP Multi-Source Agreement (MSA). It can offer maximum flexibility to designers, manufacturers, and operators of Gigabit Ethernet and Fibre Channel networking equipments.

FTM-8012C-S/FTM-8012C-L can be installed into MSA standard SFP ports at any time even with the host equipment operating online. This facilitates the rapid configuration of equipment to meet the user's needs precisely: reducing inventory costs and network downtime. Compared with traditional transceivers, the size of the Small Form Factor package enables higher port densities.

FTM-8012C-S/FTM-8012C-L meets the requirements of IEEE 802.3 Gigabit Ethernet standard and ANSI specifications for Fibre Channel. It is developed with highly reliable 850nm VCSEL.

This transceiver enables cost-effective data transmission over optical fibers at a distance of 275 meters with 62.5/125 μ m and 550 meters with 50/125 μ m multimode fiber respectively.

Low Power Dissipation

By utilizing the latest chipset technology, FTM-8012C-S/FTM-8012C-L realizes low power dissipation. Typical current is 190mA, at +3.3V operation, only 63.3% of the maximum current allowed by the SFP specification (300mA).

Optional Spring latch for high-density application

FTM-8012C-L features a spring latch that allows user to easily remove the SFP transceiver by hand even in high-density application.

Excellent EMC/EMI Performance

FTM-8012C-S/FTM-8012C-L patent mechanical design can guarantee excellent EMC/EMI performance.

Pin Definitions

Figure 6 below shows the pin numbering of SFP electrical interface. The pin functions are described in Table 6 and the accompanying notes.

Figure 6, Pin View

FTM-8012C-S/FTM-8012C-L has three stages of contact sequencing during insertion. The ground make contact at first in sequence stage 1, then followed by power supply in sequence stage 2, finally, signal lines engage in sequence stage 3. Conversely, when the module is plugged out from the host system, signal lines disengage firstly, then power supply and ground.

It is the responsibility of the system integrator to assure that no thermal, energy, or voltage hazard exists during the hot-plug-unplug sequence. It is also the responsibility of the system integrator and end-user to minimize static electricity and the probability of ESD events by careful design.

 - (>0.8V, <2.0V): Undefined
 - High (2.0~3.465V): Transmitter Disabled
 - Open: Transmitter Disabled
- MOD-DEF 0,1,2 are the module definition pins. They should be pulled up with a 4.7k~10kΩ resistor on the host board. The pull-up voltage shall be VccT or VccR.
 - MOD-DEF 0 is grounded by the module to indicate that the module is present
 - MOD-DEF 1 is the clock line of two wire serial interface for serial ID
 - MOD-DEF 2 is the data line of two wire serial interface for serial ID
- LOS is an open collector output, which should be pulled up with a 4.7k~10kΩ resistor on the host board to a voltage between 2.0V and Vcc+0.3V. Logic 0 indicates normal operation; logic 1 indicates loss of signal. In the low state, the output will be pulled to less than 0.8V.
- These are the differential receiver outputs. They are AC coupled 100Ω differential lines which should be terminated with 100Ω (differential) at the user SERDES.
- These are the differential transmitter inputs. They are AC-coupled, differential lines with 100Ω differential termination inside the module.
