Notes:

1. AC Measurements assume t_T = 5ns.
2. An initial pause of 200 us is required after power up followed by a minimum of eight initialization cycles (any combination of cycles containing $\overline{RAS}$-only refresh or $\overline{CAS}$-before-$\overline{RAS}$ refresh). If the internal refresh counter is used, a minimum of eight $\overline{CAS}$-before-$\overline{RAS}$ refresh cycles are required.
3. Operation with the t_{RCD}(max) limit insures that t_{RAC}(max) can be met, t_{RCD}(max) is specified as a reference point only; if t_{RCD} is greater than the specified t_{RCD}(max) limit, then access time is controlled exclusively by t_{CAC}.
4. Operation with the t_{RAD}(max) limit insures that t_{RAC}(max) can be met, t_{RAD}(max) is specified as a reference point only; if t_{RAD} is greater than the specified t_{RAD}(max) limit, then access time is controlled exclusively by t_{AA}.
5. Either t_{ODD} or t_{CDD} must be satisfied.
6. Either t_{DZO} or t_{DZC} must be satisfied.
7. V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} (min) and V_{IL} (max).
8. Assumes that t_{RCD} <= t_{RCD} (max) and t_{RAD} <= t_{RAD} (max). If t_{RCD} or t_{RAD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
9. Measured with a load circuit equivalent to 2TTL loads and 100pF.(V_{OH}=2.4V , V_{OL}= 0.4V)
10. Assumes that t_{RCD} >= t_{RCD} (max) and t_{RAD} <= t_{RAD} (max).
11. Assumes that t_{RCD} <= t_{RCD} (max) and t_{RAD} >= t_{RAD} (max).
12. Either t_{RCH} or t_{RRH} must be satisfied for a read cycles.
13. t_{OFF} (max) and t_{OEZ} (max) define the time at which the outputs achieve the open circuit condition and are not referred to output voltage levels.
14. t_{WCS}, t_{RWD}, t_{CWD} and t_{AWD} and t_{CPW} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if t_{WCS} >=t_{WCS}(min), the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if t_{RWD}>=t_{RWD}(min), t_{CWD}>=t_{CWD}(min), and t_{AWD}>=t_{AWD}(min) or t_{CWD}>=t_{CWD}(min), t_{AWD}>=t_{AWD}(min), and t_{CPW}>=t_{CPW}(min), the cycle is a read -modify- write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
15. These parameters are referred to $\overline{CAS}$ leading edge in early write cycle and to $\overline{WE}$ leading edge in a delayed write or a read modify write cycle.
16. t_{RASP} defines $\overline{RAS}$ pulse width in fast page mode cycles.
17. Access time is determined by the longer of t_{AA} or t_{CAC} or t_{ACP}.
18. In delayed write or read-modify-write cycles, $\overline{OE}$ must disable output buffer prior to applying data to the device. After $\overline{RAS}$ is reset, if t_{OEH}>=t_{CWL}, the I/O pin will remain open circuit (high impedance): if t_{OEH}<=t_{CWL}, invalid data will be out at each I/O.
