6. FUNCTIONAL DESCRIPTIONS

6.1. SRAM

The 512-byte SRAM (including Stack) area is located in \$000000~\$0002FF.

6.2. ROM

GPCH8A24A can be selected to use internal ROM with 1M bytes.

6.3. Low Voltage Reset

The GPCH8A24A provides another significant feature, Low Voltage Reset (LVR). Without LVR, the CPU becomes unstable and malfunctions when the operating voltage drops below 2.2V. It will reset all functions to the initial operational (stable) states when the voltage drops below 2.2V by LVR.

6.4. Interrupt

The GPCH8A24A has two interrupt (INT) modes: IRQ (interrupt Request) and NMI (Non-Mask Interrupt Request). The interrupt controller controls 10 IRQs and 6 NMIs. A NMI cannot be interrupted by any other IRQs. An IRQ can be interrupted by a NMI and by a high priority IRQ.

| Interrupt Source | Interrupt Name | Priority |
|-------------------|----------------|----------|
| Timer A | NMI_TIMER_A | NMI |
| Timer B | NMI_TIMER_B | NMI |
| Timer C | NMI_TIMER_C | NMI |

| SPU | IRQ_SPU | IRQ10 |

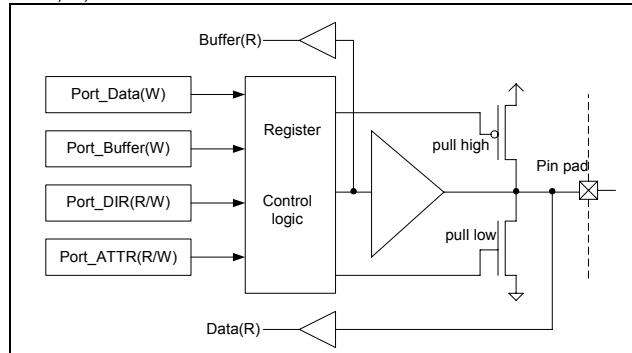

6.5. I/O

The purpose of input and output ports is to communicate with other devices. Four programmable I/O ports are built-in, including Port A, B, and C. The PortA is a general I/O with programmable wake-up capability. In addition to general I/O function, PortB also provide some special functions in certain pins. Please refer to **Special Function in PortB** for more information. PortC0~7 has large sink current (20mA) for LED application.

6.5.1. I/O Configuration

The following diagram represents the I/O schematic.

I/O A, B, C Schematic:

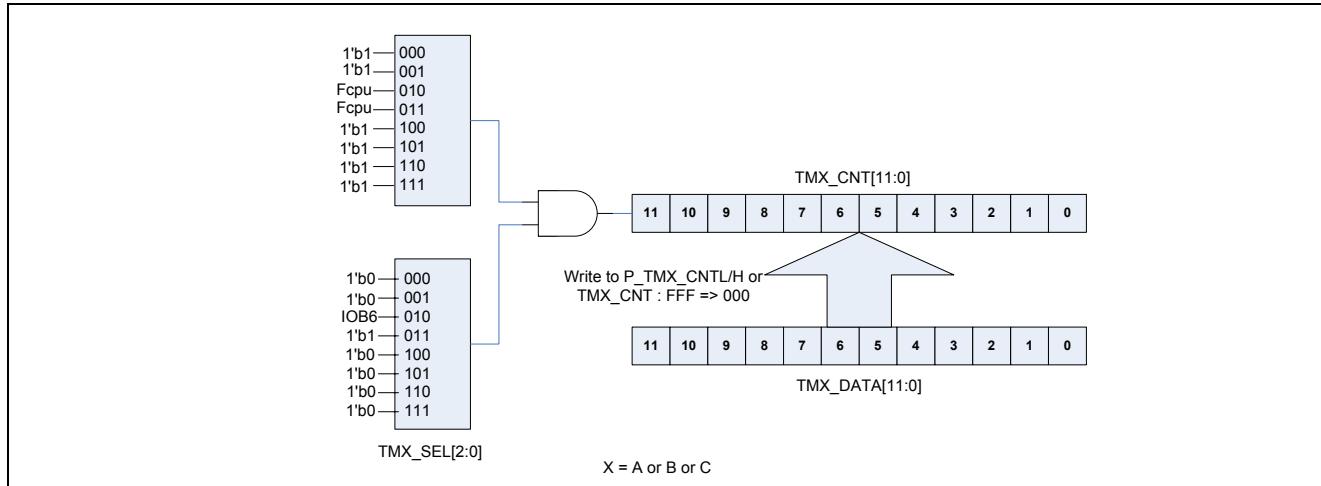

Port_Data and Port_Buffer are written into the same register but read from different nodes. The IOA [7:0] is the key wakeup port. To activate key wakeup function, first latch data on IOA_Data and enable the key wakeup function. Wakeup is triggered when the PortA state is different from first latched data. In addition to a general I/O port, PortB can be assigned to some special functions. A summary of PortB special functions is listed as follows.

Special Function in PortB

| PortB | Special Function | Function Description | Note |
|-------|------------------|--|------------------------------------|
| IOB5 | PWMO IR | IR carrier frequency output | Refer to Timer/Counter section |
| IOB6 | EXT | External interrupt source | Negative edge trigger INT(default) |
| | Feedback Output | Works with IOB7 by adding a RC circuit between them to get an OSC to EXT interrupt | - |
| IOB7 | Feedback Input | Schmitt Inverter Input | - |

6.6. Timer/Counter (Timer A/Timer B/Timer C)

Three timers are embedded in GPCH8A24A. They are Timer A, B and C. All three timers have the same behavior which includes 12-bit up-counter and a preload register and programmable clock source. Timer A can also be the clock source of the software

| 111 | '1' | '0' | Disable | Disable |

6.7. Sleep, Wakeup and Watchdog

6.7.1. Sleep and Wakeup

Sleep mode is to save power by stopping clock while device is not in use. When sleep acts, the device runs from operating mode to standby mode. Waking from sleep mode will return to operating mode.

- 1). Sleep: After power on reset, IC starts working until a sleep command is given. When a sleep signal is accepted, IC will turn off system clock and enter sleep mode.
- 2). Wake-up: While an IRQ/NMI interrupt signal is generated, GPCH8A24A is waking up from sleep mode. While wake-up procedure is completed, program counter will continue to execute the next command where it left from sleep mode.

6.7.2. Watchdog

The purpose of watchdog is to monitor system's operation normally. Within a certain period of time, watchdog must be cleared. If the watchdog is not cleared, CPU assumes the

channel. The clock source of each timer can be set individually. Two clock sources, including CPU clock and external clock, can be either individual or combinative to be timer's clock source.

program has been running into an abnormal condition and therefore, CPU will reset the system to the initial state and start running the program all over again from the beginning. It protects the system from incorrect code execution by generating a system reset when the watchdog timer overflows as a result of failure of software to clear the timer within 0.75 seconds. Watchdog function can be removed by option.

6.8. Speech and DAC

The GPCH8A24A uses a high performance SPU voice engine to achieve 8-channel voice with ADPCM/PCM. The SPU also supports automatic zero-crossing concatenate function. A hardware multiplier is also embedded in this SPU for software usage. The fixed address of RAM area \$0000 - \$007F is designed as address pointers and a data buffer for the 8 channel speech/melody generation. There are two 12-bit D/A with 4mA driving current for audio output.
