# 256K x 18 Synchronous Flow-Through Burst SRAM

## Features

- Fast access times: 7.5 and 8 ns
- Fast clock speed: 117 and 100 MHz
- Provide high-performance 2-1-1 access rate
- Fast OE access times: 4.0 ns
- 3.3V -5% and +10% power supply
- 2.5V or 3.3V I/O supply
- 5V tolerant inputs except I/Os
- Clamp diodes to V<sub>SSQ</sub> at all inputs and outputs
- Common data inputs and data outputs
- Byte Write Enable and Global Write control
- Three chip enables for depth expansion and address pipeline
- Address, data and control registers
- Internally self-timed Write Cycle
- Burst control pins (interleaved or linear burst sequence)
- Automatic power-down for portable applications
- Low profile 119-lead, 14-mm x 22-mm BGA (Ball Grid Array) and 100-pin TQFP packages

## Functional Description

The Cypress Synchronous Burst SRAM family employs high-speed, low-power CMOS designs using advanced triple-layer polysilicon, double-layer metal technology. Each memory cell consists of four transistors and two high-valued resistors.

The CY7C1325A/GVT71256E18 SRAM integrates 262,144x18 SRAM cells with advanced synchronous peripheral circuitry and a 2-bit counter for internal burst operation. All synchronous inputs are gated by registers controlled by a positive-edge-triggered Clock Input (CLK). The synchronous inputs include all addresses, all data inputs, address-pipelining Chip Enable (CE), depth-expansion Chip Enables (CE2 and CE2), Burst Control inputs (ADSC, ADSP, and ADV), Write Enables (WEL, WEH, and BWE), and Global Write (GW).

Asynchronous inputs include the Output Enable (OE) and Burst Mode Control (MODE), and Sleep Mode Control (ZZ). The data outputs (DQ), enabled by OE, are also asynchronous.

Addresses and chip enables are registered with either Address Status Processor (ADSP) or Address Status Controller (ADSC) input pins. Subsequent burst addresses can be internally generated as controlled by the Burst Advance pin (ADV).

Address, data inputs, and write controls are registered on-chip to initiate a self-timed Write cycle. Write cycles can be one to four bytes wide as controlled by the write control inputs. Individual byte write allows individual byte to be written. WEL controls DQ1-DQ8 and DQP1. WEH controls DQ9-DQ16 and DQP2. WEL and WEH can be active only with BWE being LOW. GW being LOW causes all bytes to be written.

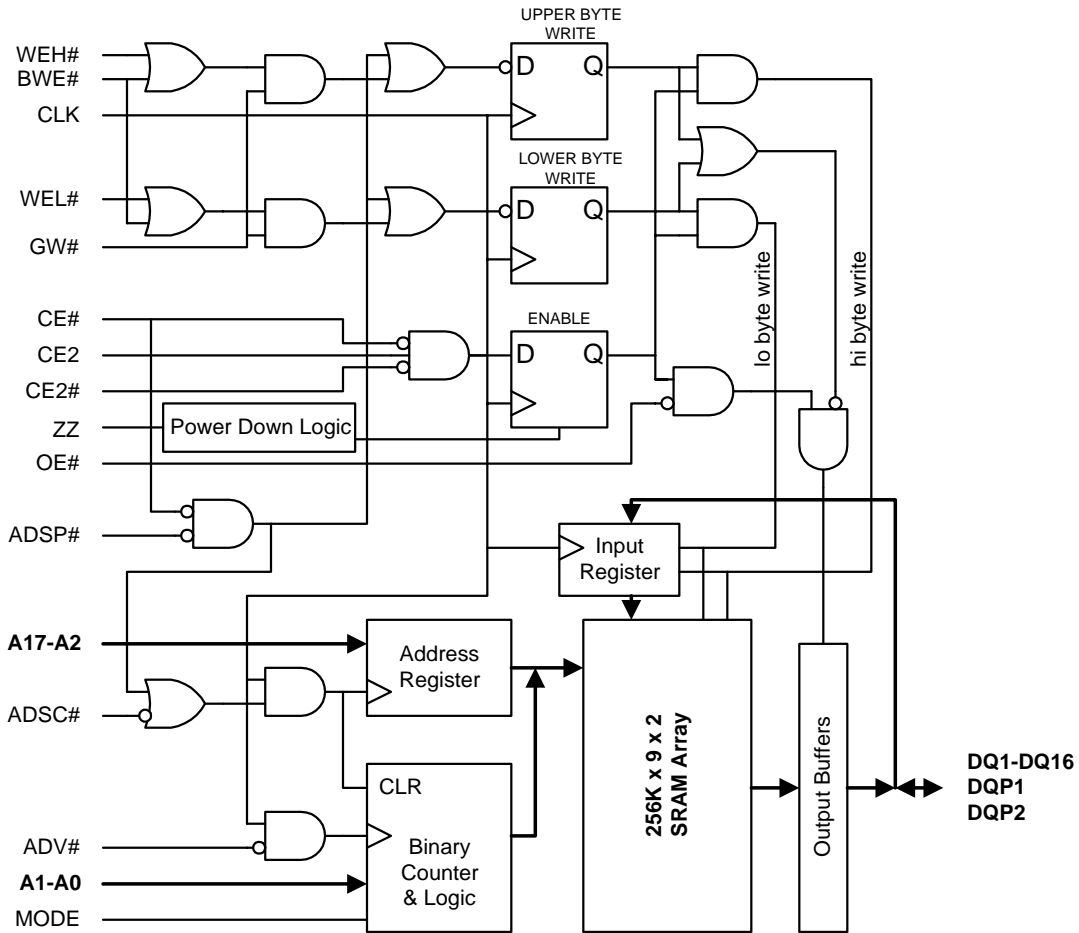

The CY7C1325A/GVT71256E18 operates from a +3.3V power supply and all outputs operate on a +2.5V supply. All inputs and outputs are JEDEC standard JESD8-5 compatible. The device is ideally suited for 486, Pentium®, 680x0, and PowerPC™ systems and for systems that benefit from a wide synchronous data bus.

**Pin Descriptions**

BGA Pins	QFP Pins	Pin Name	Type	Description
4P, 4N, 2A, 3A, 5A, 6A, 3B, 5B, 2C, 3C, 5C, 6C, 2R, 6R, 2T, 3T, 5T, 6T	37, 36, 35, 34, 33, 32, 100, 99, 82, 81, 80, 48, 47, 46, 45, 44, 49, 50	A0–A17	Input-Synchronous	Addresses: These inputs are registered and must meet the set-up and hold times around the rising edge of CLK. The burst counter generates internal addresses associated with A0 and A1, during burst cycle and wait cycle.
5L, 3G	93, 94	$\overline{\text{WEL}}$ , $\overline{\text{WEH}}$	Input-Synchronous	Byte Write Enables: A byte write enable is LOW for a Write cycle and HIGH for a Read cycle. $\overline{\text{WEL}}$ controls DQ1–DQ8 and DQP1. $\overline{\text{WEH}}$ controls DQ9–DQ16 and DQP2. Data I/O are high-impedance if either of these inputs are LOW, conditioned by BWE being LOW.
4M	87	$\overline{\text{BWE}}$	Input-Synchronous	Write Enable: This active LOW input gates byte write operations and must meet the set-up and hold times around the rising edge of CLK.
4H	88	$\overline{\text{GW}}$	Input-Synchronous	Global Write: This active LOW input allows a full 18-bit Write to occur independent of the BWE and WEn lines and must meet the set-up and hold times around the rising edge of CLK.
4K	89	CLK	Input-Synchronous	Clock: This signal registers the addresses, data, chip enables, write control and burst control inputs on its rising edge. All synchronous inputs must meet set-up and hold times around the clock's rising edge.

**Pin Descriptions** (continued)

BGA Pins	QFP Pins	Pin Name	Type	Description
4E	98	$\overline{CE}$	Input-Synchronous	Chip Enable: This active LOW input is used to enable the device and to gate ADSP.
6B	92	$\overline{CE2}$	Input-Synchronous	Chip Enable: This active LOW input is used to enable the device.
2B	97	CE2	input-Synchronous	Chip Enable: This active HIGH input is used to enable the device.
4F	86	$\overline{OE}$	Input	Output Enable: This active LOW asynchronous input enables the data output drivers.
4G	83	$\overline{ADV}$	Input-Synchronous	Address Advance: This active LOW input is used to control the internal burst counter. A HIGH on this pin generates wait cycle (no address advance).
4A	84	$\overline{ADSP}$	Input-Synchronous	Address Status Processor: This active LOW input, along with $\overline{CE}$ being LOW, causes a new external address to be registered and a Read cycle is initiated using the new address.
4B	85	$\overline{ADSC}$	Input-Synchronous	Address Status Controller: This active LOW input causes device to be deselected or selected along with new external address to be registered. A Read or Write cycle is initiated depending upon write control inputs.
3R	31	MODE	Input-Static	Mode: This input selects the burst sequence. A LOW on this pin selects Linear Burst. A NC or HIGH on this pin selects Interleaved Burst.
7T	64	ZZ	Input-Asynchronous	Snooze: This active HIGH input puts the device in low power consumption standby mode. For normal operation, this input has to be either LOW or NC (No Connect).

**Notes:**

- $X$  means "Don't Care." H means logic HIGH. L means logic LOW.  $\overline{WRITE} = L$  means  $[\overline{BWE} + \overline{WEL} * \overline{WEH}] * \overline{GW}$  equals LOW.  $\overline{WRITE} = H$  means  $[\overline{BWE} + \overline{WEL} * \overline{WEH}] * \overline{GW}$  equals HIGH.
- $\overline{WEL}$  enables write to DQ1–DQ8 and DQP1.  $\overline{WEH}$  enables write to DQ9–DQ16 and DQP2.
- All inputs except  $\overline{OE}$  must meet set-up and hold times around the rising edge (LOW to HIGH) of CLK.
- Suspending burst generates wait cycle.
- For a write operation following a read operation,  $\overline{OE}$  must be HIGH before the input data required set-up time plus High-Z time for  $\overline{OE}$  and staying HIGH throughout the input data hold time.
- This device contains circuitry that will ensure the outputs will be in High-Z during power-up.
- $\overline{ADSP}$  LOW along with chip being selected always initiates a READ cycle at the L-H edge of CLK. A WRITE cycle can be performed by setting  $\overline{WRITE}$  LOW for the CLK L-H edge of the subsequent wait cycle. Refer to WRITE timing diagram for clarification

9.  $T_A$  is the case temperature.
10. Values in table are associated with the operating frequencies listed.
11. All voltages referenced to  $V_{SS}$  (GND).
12. Overshoot:  $V_{IH} \leq +6.0V$  for  $t \leq t_{KC}/2$ .  
Undershoot:  $V_{IL} \leq -2.0V$  for  $t \leq t_{KC}/2$ .
13. MODE pin has an internal pull-up and ZZ pin has an internal pull-down. These two pins exhibit an input leakage current of  $\pm 30 \mu A$ .
14. AC I/O curves are available upon request.
15.  $I_{CC}$  is given with no output current.  $I_{CC}$  increases with greater output loading and faster cycle times.
16. "Device Deselected" means the device is in Power-Down mode as defined in the truth table. "Device Selected" means the device is active.
17. Typical values are measured at 3.3V, 25°C and 20-ns cycle time.
