

# 20 MBd High CMR Logic Gate Optocouplers

## Technical Data

### HCPL-2400 HCPL-2430

#### Features

- **High Speed: 40 MBd Typical Data Rate**
- **High Common Mode Rejection:**  
HCPL-2400: 10 kV/ $\mu$ s at  $V_{CM} = 300$  V (Typical)
- **AC Performance Guaranteed over Temperature**
- **High Speed AlGaAs Emitter**
- **Compatible with TTL, STTL, LSTTL, and HCMOS Logic Families**
- **Totem Pole and Tri State Output (No Pull Up Resistor Required)**
- **Safety Approval**  
UL Recognized – 2500 V rms for 1 minute per UL1577  
VDE 0884 Approved with  $V_{IORM} = 630$  V peak (Option 060) for HCPL-2400  
CSA Approved
- **High Power Supply Noise Immunity**
- **MIL-STD-1772 Version Available (HCPL-5400/1 and HCPL-5430/1)**

#### Applications

- **Isolation of High Speed Logic Systems**
- **Computer-Peripheral Interfaces**
- **Switching Power Supplies**
- **Isolated Bus Driver (Networking Applications)**
- **Ground Loop Elimination**
- **High Speed Disk Drive I/O**
- **Digital Isolation for A/D, D/A Conversion**
- **Pulse Transformer Replacement**

#### Description

The HCPL-2400 and HCPL-2430 high speed optocouplers combine an 820 nm AlGaAs light emitting diode with a high speed photodetector. This combination results in very high data rate capability and low input current. The totem pole output (HCPL-2430) or three state output (HCPL-2400) eliminates the need for a pull up resistor and allows for direct drive of data buses.

#### Functional Diagram

TRUTH TABLE  
(POSITIVE LOGIC)

LED	ENABLE	OUTPUT
ON	L	L
OFF	L	H
ON	H	Z
OFF	H	Z

TRUTH TABLE  
(POSITIVE LOGIC)

LED	OUTPUT
ON	L
OFF	H

A 0.1  $\mu$ F bypass capacitor must be connected between pins 5 and 8.

**CAUTION:** It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

The detector has optical receiver input stage with built-in Schmitt trigger to provide logic compatible waveforms, eliminating the need for additional waveshaping. The hysteresis provides differential mode noise immunity and minimizes the potential for output signal chatter.

The electrical and switching characteristics of the HCPL-2400 and HCPL-2430 are guaranteed over the temperature range of 0°C to 70°C.

These optocouplers are compatible with TTL, STTL, LSTTL, and HCMOS logic

families. When Schottky type TTL devices (STTL) are used, a data rate performance of 20 MBd over temperature is guaranteed when using the application circuit of Figure 13. Typical data rates are 40 MBd.

### Selection Guide

8-Pin DIP (300 Mil)		Minimum CMR		Minimum Input On Current (mA)	Maximum Propagation Delay (ns)	Hermetic Package
Single Channel Package	Dual Channel Package	dV/dt (V/μs)	V <sub>CM</sub> (V)			
HCPL-2400		1000	300	4	60	
	HCPL-2430	1000	50	4	60	
		500	50	6	60	HCPL-540X*
		500	50	6	60	HCPL-543X*
		500	50	6	60	HCPL-643X*

\*Technical data for the Hermetic HCPL-5400/01, HCPL-5430/31, and HCPL-6430/31 are on separate HP publications.

### Ordering Information

Specify Part Number followed by Option Number (if desired).

Example:

HCPL-2400#XXX

- 060 = VDE 0884 V<sub>IORM</sub> = 630 V<sub>peak</sub> Option\*
- 300 = Gull Wing Surface Mount Option
- 500 = Tape and Reel Packaging Option

\*For HCPL-2400 only.

### Schematic

## Package Outline Drawings

### 8-Pin DIP Package (HCPL-2400, HCPL-2430)

### 8-Pin DIP Package with Gull Wing Surface Mount Option 300 (HCPL-2400, HCPL-2430)

## Solder Reflow Temperature Profile (Gull Wing Surface Mount Option 300 Parts)

Note: Use of nonchlorine activated fluxes is highly recommended.

### Regulatory Information

The HCPL-24XX has been approved by the following organizations:

**UL**  
Recognized under UL 1577,  
Component Recognition  
Program, File E55361.

### VDE

Approved according to VDE  
0884/06.92 (Option 060 only).

**CSA**  
Approved under CSA Component  
Acceptance Notice #5, File CA  
88324.

### Insulation and Safety Related Specifications

Parameter	Symbol	Value	Units	Conditions
Minimum External Air Gap (External Clearance)	L(101)	7.1	mm	Measured from input terminals to output terminals, shortest distance through air.
Minimum External Tracking (External Creepage)	L(102)	7.4	mm	Measured from input terminals to output terminals, shortest distance path along body.
Minimum Internal Plastic Gap (Internal Clearance)		0.08	mm	Through insulation distance, conductor to conductor, usually the direct distance between the photoemitter and photodetector inside the optocoupler cavity.
Tracking Resistance (Comparative Tracking Index)	CTI	200	Volts	DIN IEC 112/VDE 0303 Part 1
Isolation Group		IIIa		Material Group (DIN VDE 0110, 1/89, Table 1)

Option 300 - surface mount classification is Class A in accordance with CECC 00802.

**VDE 0884 Insulation Related Characteristics  
(HCPL-2400 OPTION 060 ONLY)**

Description	Symbol	Characteristic	Units
Installation classification per DIN VDE 0110/1.89, Table 1 for rated mains voltage $\leq 300$ V rms for rated mains voltage $\leq 450$ V rms		I-IV	
		I-III	
Climatic Classification		55/85/21	
Pollution Degree (DIN VDE 0110/1.89)		2	
Maximum Working Insulation Voltage	$V_{IORM}$	630	V <sub>peak</sub>
Input to Output Test Voltage, Method b* $V_{IORM} \times 1.875 = V_{PR}$ , 100% Production Test with $t_m = 1$ sec, Partial Discharge $< 5$ pC	$V_{PR}$	1181	V <sub>peak</sub>
Input to Output Test Voltage, Method a* $V_{IORM} \times 1.5 = V_{PR}$ , Type and sample test, $t_m = 60$ sec, Partial Discharge $< 5$ pC	$V_{PR}$	945	V <sub>peak</sub>
Highest Allowable Overvoltage* (Transient Overvoltage, $t_{ini} = 10$ sec)	$V_{IOTM}$	6000	V <sub>peak</sub>
Safety Limiting Values (Maximum values allowed in the event of a failure, also see Figure 12, Thermal Derating curve.)			
Case Temperature	$T_S$	175	°C
Input Current	$I_{S,INPUT}$	230	mA
Output Power	$P_{S,OUTPUT}$	600	mW
Insulation Resistance at $T_S$ , $V_{IO} = 500$ V	$R_S$	$\geq 10^9$	$\Omega$

\*Refer to the front of the optocoupler section of the current catalog, under Product Safety Regulations section (VDE 0884) for a detailed description.

Note: Isolation characteristics are guaranteed only within the safety maximum ratings which must be ensured by protective circuits in application.

## Absolute Maximum Ratings

(No derating required up to 70°C)

Parameter	Symbol	Minimum	Maximum	Units	Note
Storage Temperature	$T_S$	-55	125	°C	
Operating Temperature	$T_A$	-40	85	°C	
Average Forward Input Current	$I_{F(AVG)}$		10	mA	
Peak Forward Input Current	$I_{FPK}$		20	mA	12
Reverse Input Voltage	$V_R$		2	V	
Three State Enable Voltage (HCPL-2400 Only)	$V_E$	-0.5	10	V	
Supply Voltage	$V_{CC}$	0	7	V	
Average Output Collector Current	$I_O$	-25	25	mA	
Output Collector Voltage	$V_O$	-0.5	10	V	
Output Voltage	$V_O$	-0.5	18	V	
Output Collector Power Dissipation (Each Channel)	$P_O$		40	mW	
Total Package Power Dissipation (Each Channel)	$P_T$		350	mW	
Lead Solder Temperature (for Through Hole Devices)	260°C for 10 sec., 1.6 mm below seating plane				
Reflow Temperature Profile (Option #300)	See <b>Package Outline Drawings</b> section				

## Recommended Operating Conditions

Parameter	Symbol	Minimum	Maximum	Units
Power Supply Voltage	$V_{CC}$	4.75	5.25	V
Forward Input Current (ON)	$I_{F(ON)}$	4	8	mA
Forward Input Voltage (OFF)	$V_{F(OFF)}$		0.8	V
Fan Out	N		5	TTL Loads
Enable Voltage (Low) HCPL-2400 Only)	$V_{EL}$	0	0.8	V
Enable Voltage (High) HCPL-2400 Only)	$V_{EH}$	2	$V_{CC}$	V
Operating Temperature	$T_A$	0	70	°C

## Electrical Specifications

$0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$ ,  $4.75\text{ V} \leq V_{CC} \leq 5.25\text{ V}$ ,  $4\text{ mA} \leq I_{F(\text{ON})} \leq 8\text{ mA}$ ,  $0\text{ V} \leq V_{F(\text{OFF})} \leq 0.8\text{ V}$ . All typicals at  $T_A = 25^{\circ}\text{C}$ ,  $V_{CC} = 5\text{ V}$ ,  $I_{F(\text{ON})} = 6.0\text{ mA}$ ,  $V_{F(\text{OFF})} = 0\text{ V}$ , except where noted. See Note 11.

Parameter	Symbol	Device HCPL-	Min.	Typ.*	Max.	Units	Test Conditions	Fig.	Note

## Package Characteristics

Parameter	Sym.	Device	Min.	Typ.*	Max.	Units	Test Conditions	Fig.	Note
Input-Output Momentary Withstand Voltage**	$V_{ISO}$		2500			V rms	RH $\leq$ 50%, t = 1 min., $T_A = 25^\circ\text{C}$		3, 13
Input-Output Resistance	$R_{I-O}$			$10^{12}$		$\Omega$	$V_{I-O} = 500$ Vdc		3
Input-Output Capacitance	$C_{I-O}$			0.6		pF	f = 1 MHz $V_{I-O} = 0$ Vdc		
Input-Input Insulation Leakage Current	$I_{I-I}$	2430		0.005		$\mu\text{A}$	RH $\leq$ 45% t = 5 s, $V_{I-I} = 500$ Vdc		8
Resistance (Input-Input)	$R_{I-I}$	2430		$10^{11}$		$\Omega$	$V_{I-I} = 500$ Vdc		8
Capacitance (Input-Input)	$C_{I-I}$	2430		0.25		pF	f = 1 MHz		8

\*All typical values are at  $T_A = 25^\circ\text{C}$ .

\*\*The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating refer to the VDE 0884 Insulation Related Characteristics Table (if applicable), your equipment level safety specification or HP Application Note 1074 entitled "Optocoupler Input-Output Endurance Voltage," publication number 5963-2203E.

### Notes:

- Each channel.
- Duration of output short circuit time not to exceed 10 ms.
- Device considered a two terminal device: pins 1, 2, 3, and 4 shorted together, and pins 5, 6, 7, and 8 shorted together.
- $t_{PHL}$  propagation delay is measured from the 50% level on the rising edge of the input current pulse to the 1.5 V level on the falling edge of the output pulse. The  $t_{PLH}$  propagation delay is measured from the 50% level on the falling edge of the input current pulse to the 1.5 V level on the rising edge of the output pulse.
- The typical data shown is indicative of what can be expected using the application circuit in Figure 13.
- This specification simulates the worst case operating conditions of the HCPL-2400 over the recommended operating temperature and  $V_{CC}$  range with the suggested application circuit of Figure 13.
- Propagation delay skew is discussed later in this data sheet.
- Measured between pins 1 and 2 shorted together, and pins 3 and 4 shorted together.
- Common mode transient immunity in a Logic High level is the maximum tolerable (positive)  $dV_{CM}/dt$  of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in a Logic High state (i.e.,  $V_O > 2.0$  V. Common mode transient immunity in a Logic Low level is the maximum tolerable (negative)  $dV_{CM}/dt$  of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in a Logic Low state (i.e.,  $V_O < 0.8$  V).
- Power Supply Noise Immunity is the peak to peak amplitude of the ac ripple voltage on the  $V_{CC}$  line that the device will withstand and still remain in the desired logic state. For desired logic high state,  $V_{OH(MIN)} > 2.0$  V, and for desired logic low state,  $V_{OL(MAX)} < 0.8$  V.
- Use of a 0.1  $\mu\text{F}$  bypass capacitor connected between pins 8 and 5 adjacent to the device is required.
- Peak Forward Input Current pulse width  $< 50$   $\mu\text{s}$  at 1 KHz maximum repetition rate.
- In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage  $\geq 3000$  V rms for one second (leakage detection current limit,  $I_{I-O} \leq 5$   $\mu\text{A}$ ). This test is performed before the 100% Production test shown in the VDE 0884 Insulation Related Characteristics Table, if applicable.

## Propagation Delay, Pulse-Width Distortion and Propagation Delay Skew

Propagation delay is a figure of merit which describes how quickly a logic signal propagates through a system. The propagation delay from low to high ( $t_{PLH}$ ) is the amount of time required for an input signal to propagate to the output, causing the output to change from low to high. Similarly, the propagation delay from high to low ( $t_{PHL}$ ) is the amount of time required for the input signal to propagate to the output, causing the output to change from high to low (see Figure 5).

Pulse-width distortion (PWD) results when  $t_{PLH}$  and  $t_{PHL}$  differ in value. PWD is defined as the difference between  $t_{PLH}$  and  $t_{PHL}$  and often determines the maximum data rate capability of a transmission system. PWD can be expressed in percent by dividing the PWD (in ns) by the minimum pulse width (in ns) being transmitted. Typically, PWD on the order of 20-30% of the minimum pulse width is tolerable; the exact figure depends on the particular application (RS232, RS422, T-1, etc.).

Propagation delay skew,  $t_{PSK}$ , is an important parameter to consider in parallel data applications where synchronization of signals on parallel data lines is a concern. If the parallel data is being sent through a group of optocouplers, differences in propagation delays will cause the data to arrive at the outputs of the optocouplers at different times. If this difference in propagation delays is large enough, it will

determine the maximum rate at which parallel data can be sent through the optocouplers.

Propagation delay skew is defined as the difference between the minimum and maximum propagation delays, either  $t_{PLH}$  or  $t_{PHL}$ , for any given group of optocouplers which are operating under the same conditions (i.e., the same drive current, supply voltage, output load, and operating temperature). As illustrated in Figure 15, if the inputs of a group of optocouplers are switched either ON or OFF at the same time,  $t_{PSK}$  is the difference between the shortest propagation delay, either  $t_{PLH}$  or  $t_{PHL}$ , and the longest propagation delay, either  $t_{PLH}$  or  $t_{PHL}$ .

As mentioned earlier,  $t_{PSK}$  can determine the maximum parallel data transmission rate. Figure 16 is the timing diagram of a typical parallel data application with both the clock and the data lines being sent through optocouplers. The figure shows data and clock signals at the inputs and outputs of the optocouplers. To obtain the maximum data transmission rate, both edges of the clock signals are being used to clock the data; if only one edge were used, the clock signal would need to be twice as fast.

Propagation delay skew represents the uncertainty of where an edge might be after being sent through an optocoupler. Figure 16 shows that there will be uncertainty in both the data and the clock lines. It is important that these two areas of uncertainty not overlap, otherwise the clock signal might arrive before all of

the data outputs have settled, or some of the data outputs may start to change before the clock signal has arrived. From these considerations, the absolute minimum pulse width that can be sent through optocouplers in a parallel application is twice  $t_{PHZ}$ . A cautious design should use a slightly longer pulse width to ensure that any additional uncertainty in the rest of the circuit does not cause a problem.

The HCPL-2400/30 optocouplers offer the advantages of guaranteed specifications for propagation delays, pulse-width distortion, and propagation delay skew over the recommended temperature, input current, and power supply ranges.

## Application Circuit

A recommended LED drive circuit is shown in Figure 13. This circuit utilizes several techniques to minimize the total pulse-width distortion at the output of the optocoupler. By using two inverting TTL gates connected in series, the inherent pulse-width distortion of each gate cancels the distortion of the other gate. For best results, the two series-connected gates should be from the same package.

The circuit in Figure 13 also uses techniques known as prebias and peaking to enhance the performance of the optocoupler LED. Prebias is a small forward voltage applied to the LED when the LED is off. This small prebias voltage partially charges the junction capacitance of the LED, allowing the LED to turn on more quickly. The speed of the LED is further increased by applying

momentary current peaks to the LED during the turn-on and turn-off transitions of the drive current. These peak currents help to charge and discharge the capacitances of the LED more quickly, shortening the time required for the LED to turn on and off.

Switching performance of the HCPL-2400/30 optocouplers is not sensitive to the TTL logic family used in the recommended drive circuit. The typical and worst-case switching parameters given in the data sheet can be met using common 74LS TTL inverting gates or buffers. Use of faster TTL families will slightly reduce the overall propagation delays from the input of the drive circuit

to the output of the optocoupler, but will not necessarily result in lower pulse-width distortion or propagation delay skew. This reduction in overall propagation delay is due to shorter delays in the drive circuit, not to changes in the propagation delays of the optocoupler; optocoupler propagation delays are not affected by the speed of the logic used in the drive circuit.
