

HD648180W

MCU (Micro Controller Unit)

DESCRIPTION

The HD648180W is an 8-bit CMOS microcontroller in the HD64180 family. Its instruction set is upward-compatible with the HD64180Z, hence with the Z-80. Twelve instructions (seven types) have been added, bringing the total number of instructions to 165.

Compared with the HD64180Z, the HD648180W also has more peripheral functions. In addition to a refresh controller and wait-state controller for memory access support, and a memory management unit (MMU) and DMA controller (DMAC) for processing large quantities of data, the HD64180W has on-chip RAM, EEPROM, and an A/D converter. Timer and I/O-port functions have also been enhanced.

Figure 1 shows the HD64180 family. Table 1 lists the features of the HD64180W.

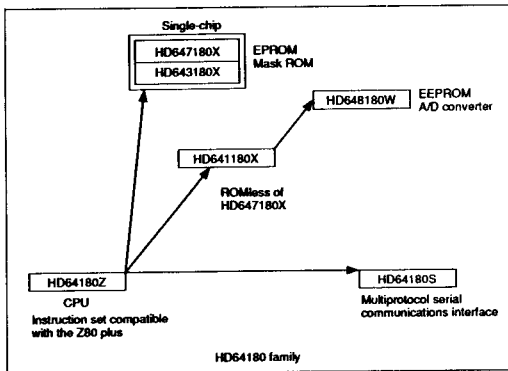

Figure 1 HD64180 Family

ORDERING INFORMATION

Type No.	Speed and Package
HD648180W0CP4	4 MHz 84-pin PLCC
HD648180W0CP6	6 MHz 84-pin PLCC
HD648180W0F4	4 MHz 80-pin QFP
HD648180W0F6	6 MHz 80-pin QFP

Table 1 HD648180W Features

Item	Description
CPU	<ul style="list-style-type: none"> • Instruction set upward-compatible with HD64180Z • Maximum operating speed: 6.144 MHz
MMU	<ul style="list-style-type: none"> • 1-Mbyte physical address space
Memory	<ul style="list-style-type: none"> • 256-byte EEPROM on-chip —Byte or page write • 1-kbyte static RAM on-chip —Provides work area, stack area for interrupts, etc.
Timers (4 channels)	<ul style="list-style-type: none"> • 16-bit free-running timer (1 channel) on-chip —Input capture function for measuring input pulse width —Output compare function for generating waveforms • 16-bit reload timers (3 channels) on-chip —Toggle function for square-wave output with 50% duty cycle
Serial communication interface (2 channels)	<ul style="list-style-type: none"> • Asynchronous or clocked synchronous mode • Simultaneous transmit and receive (full duplex communication) • On-chip baud rate generator
DMA controller (2 channels)	<ul style="list-style-type: none"> • Directly addresses 1-Mbyte address space (without using MMU) • Directly addresses 64-kbyte I/O address space • Can transfer 64-kbyte data continuously • Data transfer speed (memory-to-memory): six system clocks/byte
A/D converter (8-bit resolution)	<ul style="list-style-type: none"> • Four analog input channels • Absolute precision: 2.0 LSB • Conversion time: 17 μs (at 6 MHz)
I/O ports	<ul style="list-style-type: none"> • 30 input/output lines (including 10 with direct LED driving capability: $I_{OL} = 10$ mA) • 4 input lines • 1 output line
Wait-state controller	<ul style="list-style-type: none"> • Wait states can be inserted by external signal input or by software
Refresh controller	<ul style="list-style-type: none"> • Outputs 8-bit refresh addresses • Programmable refresh interval

• Pin Functions

Table 2 Pin Functions

Type	Signal	Pin Number		I/O	Name and Pin Function
		FP-80A	PC-84		
Power supply GND	V _{CC}	14, 56	26, 70	Input	Power Supply: Connect all V _{CC} pins to system power supply (+5 V).
	V _{SS}	10, 31, 59	21, 44, 73	Input	Ground: Connect all V _{SS} pins to system power supply (0 V).
XTAL clock	XTAL	57	71	Input	Connect to crystal oscillator with twice system clock (ϕ) frequency. When inputting external clock at EXTAL, leave XTAL open.
	EXTAL	58	72	Input	Connect to crystal oscillator or external clock. External clock frequency should be 2 times system clock.

Oscillator circuit examples

ϕ		61	75	Output	System Clock: Supplies system clock to peripheral devices.
Reset	$\overline{\text{RESET}}$	60	74	Input	Reset: Chip is reset when this pin is dropped low.
Address bus	A ₀ to A ₁₉	1 to 9, 70 to 80	1 to 20, 84	Output (Tri-state)	Address Bus: For memory access. These lines go to high impedance only in the following cases. a. During reset b. When bus control is granted to another device (when $\overline{\text{BUSACK}}$ drops low because of low input at $\overline{\text{BUSREQ}}$).

3

Table 2 Pin Functions (cont)

Type	Signal	Pin Number		I/O	Name and Pin Function
		FP-80A	PC-84		
Data bus	D ₀ to D ₇	15 to 22	27 to 34	Input/ Output	Data Bus: 8-bit, bidirectional data bus
Memory I/O interface signal	\overline{RD}	68	82	Output (Tri-state)	Read: Indicates chip is in read cycle. At this time, data bus is in input mode.
	\overline{WR}	67	81	Output (Tri-state)	Write: Indicates chip is in write cycle. At this time, data bus is in output mode.
	\overline{ME}	65	79	Output (Tri-state)	Memory Enable: Indicates memory read/write is being performed. Goes low in the following cases: a. Instruction fetch and operand read b. Data read/write by memory reference instruction c. Memory access during DMA cycle d. Refresh cycle
	\overline{IOE}	64	78	Output (Tri-state)	I/O Enable: Indicates I/O read/write is being performed. Goes low in the following cases: a. Data read/write by I/O instruction execution b. I/O access during DMA cycle c. $\overline{INT_0}$ acknowledge cycle
	\overline{WAIT}	13	25	Input	Wait: Used to extend memory and I/O read/write cycles. If low at the falling clock edge in a T ₂ or T _W state, a T _W state is inserted next.
System control signals	BUSREQ	11	23	Input	Bus Request: Used by another device to issue a bus request. When this pin goes low, CPU terminates instruction execution and sets address bus, data bus, and some memory interface signals (\overline{RD} , \overline{WR} , \overline{ME} , \overline{IOE}) to high impedance.

Table 2 Pin Functions (cont)

Type	Signal	Pin Number		I/O	Name and Pin Function
		FP-80A	PC-84		
System control signals	$\overline{\text{BUSACK}}$	12	24	Output	Bus Acknowledge: Indicates receipt of $\overline{\text{BUSREQ}}$ signal by CPU and release of bus. Notifies device that output $\overline{\text{BUSREQ}}$ signal that bus is under its control.
	$\overline{\text{HALT}}$	63	77	Output	HALT: Goes low when CPU executes HALT or SLP instruction to indicate that CPU is in halt or sleep mode. Used together with ST and LIR signals (described below) to indicate operational status of internal DMA and CPU mode.
	$\overline{\text{LIR}}$	66	80	Output	Load Instruction Register: Indicates ongoing cycle is op code fetch cycle.
	ST	62	76	Output	Status: Indicates operational status. Do not connect pull-down resistance to this pin.

ST	$\overline{\text{HALT}}$	$\overline{\text{LIR}}$	Operation Mode
0	1	0	CPU operation (1st op-code fetch cycle)
1	1	0	CPU operation (2nd, 3rd op-code fetch cycle)
1	1	1	CPU operation (machine cycles other than op-code fetch cycles)
0	Undefined	1	DMA
0	0	0	Halt mode
1	0	1	Sleep mode

3

Table 2 Pin Functions (cont)

Type	Signal	Pin Number		I/O	Name and Pin Function							
		FP-80A	PC-84									
System control signals	$\overline{\text{REF}}$	69	83	Output	Refresh: Low level indicates CPU is in DRAM refresh cycle. Refresh address is output on lower 8 bits of address bus (A_0 through A_7). Refresh cycle interval can be programmed to 10, 20, 40, or 80 states.							
Interrupt signals	$\overline{\text{NMI}}$	44	57	Input	Non-Maskable Interrupt: Non-maskable interrupt request pin.							
	$\overline{\text{INT}}_0$	45	58	Input	Interrupt 0: Maskable interrupt level 0 request pin. Level 0 has 3 modes.							
					<table border="1"> <thead> <tr> <th>Mode</th> <th>Meaning</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Execute instruction on data bus</td> </tr> <tr> <td>1</td> <td>Execute instructions starting from address 0038H</td> </tr> <tr> <td>2</td> <td>Vectored</td> </tr> </tbody> </table>	Mode	Meaning	0	Execute instruction on data bus	1	Execute instructions starting from address 0038H	2
Mode	Meaning											
0	Execute instruction on data bus											
1	Execute instructions starting from address 0038H											
2	Vectored											
	$\overline{\text{INT}}_1$	48	61	Input	Interrupt 1, 2: Maskable interrupt Level 1 and 2 request pins. Vectored.							
	$\overline{\text{INT}}_2$	46	59	Input								
DMA signals	$\overline{\text{DREQ}}_0$	33	46	Input	<p>DMA Request for Channel 0: Asks internal DMAC to perform transfer on channel 0. Enables internal DMAC to synchronize with external I/O device. Internal DMAC channel 0 supports the following transfers.</p> <ol style="list-style-type: none"> Memory ↔ Memory Memory ↔ I/O Memory ↔ Memory-mapped I/O 							

Table 2 Pin Functions (cont)

Type	Signal	Pin Number		I/O	Name and Pin Function
		FP-80A	PC-84		
DMA signals	$\overline{\text{TEND}}_0$	32	45	Output	Transfer End for Channel 0: Internal DMAC channel 0 transfer end signal. This signal goes low at write cycle of final data transfer.
	$\overline{\text{DREQ}}_1$	35	48	Input	DMA Request for Channel 1: Asks internal DMAC to perform transfer on channel 1. Channel 1 supports Memory ↔ I/O transfers only.
	$\overline{\text{TEND}}_1$	34	47	Output	Transfer End for Channel 1: Internal DMAC channel 1 transfer end signal. This signal goes low at write cycle of final data transfer.
Serial communications	TX_0	43	56	Output	Transmit Data for SCI Channel 0: SCI channel 0 transmit data pin.
	RX_0	42	55	Input	Receive Data for SCI Channel 0: SCI channel 0 receive data pin.
	SCK_0	41	54	Input/Output	Serial Clock for SCI Channel 0: SCI channel 0 clock input/output pin.
	TX_1	40	53	Output	Transmit Data for SCI Channel 1: SCI channel 1 transmit data pin.
	RX_1	39	52	Input	Receive Data for SCI Channel 1: SCI channel 1 receive data pin.
	SCK_1	38	51	Input/Output	Serial Clock for SCI Channel 1: SCI channel 1 clock input/output pin.

Table 2 Pin Functions (cont)

Type	Signal	Pin Number		I/O	Name and Pin Function
		FP-80A	PC-84		
Timers	TIN ₁	35	48	Input	Timer Input for Channel 1: Input signal pin for timer 1 input capture. Signal transitions at this pin transfer free-running counter value to input capture register.
	TOUT ₁	37	50	Output	Timer Output for Channel 1: Timer 1 waveform output pin. When output compare register and free-running counter match, value of OLVL bit of timer control/status register 1 is output from this pin.
	TOUT ₂	36	49	Output	Timer Output for Channel 2: Timer 2 waveform output pin. When timer 2 time constant register and timer 2 up-counter match, value selected by bit 2 and bit 3 of timer control/status register 2 is output from this pin.
	TOUT ₃	32	45	Output	Timer Output for Channel 3: Timer 3 waveform output pin. When timer 3 time constant register and timer 3 up-counter match, value selected by bit 2 and bit 3 of timer control/status register 2 is output from this pin.
	TOUT ₄	34	47	Output	Timer Output for Channel 4: Timer 4 waveform output pin. When timer 4 time constant register and timer 4 up-counter match, value selected by bit 2 and bit 3 of timer control/status register 4 is output from this pin.

Table 2 Pin Functions (cont)

Type	Signal	Pin Number		I/O	Name and Pin Function
		FP-80A	PC-84		
A/D converter	AV _{SS}	55	69	Input	Analog Ground: A/D converter power supply (ground)
	AV _{CC}	50	63	Input	Analog Power Supply: A/D converter power supply (+5 V). Connect to system power supply (V _{CC}).
	AN ₀ to AN ₃	51 to 54	65 to 68	Input	Analog Input: A/D converter input signal pins
	AD \bar{T}	48	61	Input	A/D Trigger: External trigger input pin to start A/D converter
EEPROM	V _{PP}	49	62	Output	Test pin. Do not connect.
Parallel I/O	P0 ₀ to P0 ₇	23 to 30	35 to 42	Input/ Output	Port 0: 8-bit parallel I/O port. Switched between input and output by data direction register 0 (DDR0).
	P1 ₀ to P1 ₇	36 to 43	49 to 56	Input/ Output	Port 1: 8-bit parallel I/O port. Switched between input and output by data direction register 1 (DDR1).
	P2 ₀ to P2 ₆	6 to 9, 11, 12, 69	17 to 20, 23, 24, 83	Input/ Output	Port 2: 7-bit parallel I/O port. Switched between input and output by data direction register 2 (DDR2). P26 is output only.
	P3 ₀ to P3 ₇	32 to 35, 45 to 48	45 to 48, 58 to 61	Input/ Output	Port 3: 8-bit parallel I/O port. Switched between input and output by data direction register 3 (DDR3).
	P4 ₀ to P4 ₃	51 to 54	65 to 68	Input	Port 4: 4-bit input-only port.

■ Basic CPU Architecture

The HD648180W has an advanced, high-speed, eight-bit CPU. Its instruction set is upward-compatible with the HD64180Z.

• Features

The HD648180W CPU has the following features.

- CPU architecture based on the Z-80
- Expanded instruction set with instructions for:
 - Input from on-chip I/O
 - Output to on-chip I/O
 - Block transfer between memory and on-chip I/O
 - 8-bit × 8-bit multiplication
 - AND operations on on-chip I/O
 - AND operations on accumulator A
 - Transition to sleep mode
- Eight addressing modes
 - Implied
 - Register direct
 - Register indirect
 - Indexed
 - Extended
 - Immediate
 - Relative
 - I/O
- Maximum operating speed: 6.144 MHz
- Special CPU operating modes
 - Low-power modes (standby modes)
 - Software standby mode
 - Hardware standby mode
 - Sleep mode
 - Halt mode
 - Bus-release mode

• Address Space

The HD648180W CPU has a 64-kbyte logical address space and 64-kbyte I/O address space.

The 64-kbyte logical address space is mapped into a 1-Mbyte physical address space by the memory management unit (MMU). For details, see Memory Management Unit (MMU).

The 64-kbyte I/O address space is assigned to on-chip and off-chip I/O. For details, see On-Chip I/O Address Space Map.

• Register Configuration

The CPU includes two general register sets (GR and GR'), and a single special-purpose register set. Register sets GR and GR' each include an accumulator, a flag register, and six general-purpose registers. The special-purpose register set consists of an interrupt vector register, an R counter, two 16-bit index registers, a stack pointer, and a program counter.

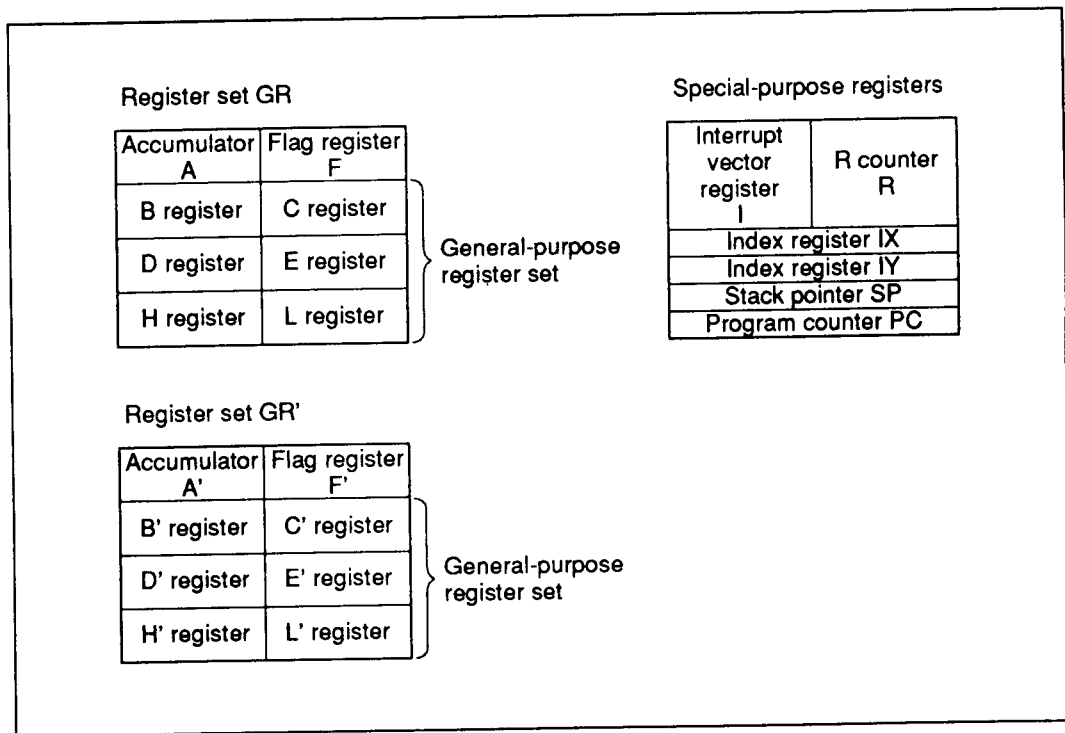

Figure 5 CPU Register Configuration

• Register Descriptions

The following table describes the function of each register. Unless otherwise specified, register content is undefined following a reset.

Register Name	Symbol	Function
Accumulators	A, A'	Accumulators are registers in which 8-bit arithmetic operations, logical operations, and shifts are performed. Accumulator A' is used in place of accumulator A following execution of the instruction EX AF, AF'.
Flag registers	F, F'	Flag registers store the status of operations. Flag register F' is used in place of flag register F following execution of the instruction EX AF, AF'.
General-purpose registers	B, C D, E H, L	The registers in register set GR can be used as 8-bit registers (B, C, D, E, H, L) or 16-bit registers (BC, DE, HL). They can be used to execute operations or store addresses.
	B', C' D', E' H', L'	The registers in register set GR' supplement the GR registers. The two register sets can be swapped using the EXX instruction.
Interrupt vector register	I	This 8-bit register stores the upper 8 bits of the 16-bit vector produced by an interrupt. Vectors are used for \overline{INT}_0 mode 2, \overline{INT}_1 , \overline{INT}_2 , and internal interrupts (7 sources). A reset initializes this register to 00H.
R counter	R	This 8-bit register counts the number of op-code fetch cycles performed. The content of this counter is unrelated to the refresh address, which is generated by another on-chip counter that cannot be accessed by the user. A reset initializes this register to 00H.
Index registers	IX, IY	These 16-bit registers are used for indexed addressing and 16-bit operations. In indexed addressing, the base address is stored in the index registers. A signed 8-bit displacement is added to the base address to generate the operand's effective address. In 16-bit operations that involve the index registers, a general-purpose register (except HL), the index registers, or the stack pointer can be used for the other operand.
Stack pointer	SP	This 16-bit register stores the top address of the stack area. A reset initializes this register to 00H.
Program counter	PC	This 16-bit register stores the logical address of the next instruction to be executed. This register is normally incremented by 1 each time a 1-byte instruction code is accessed, but execution of a jump instruction causes the address of the jump destination to replace the current content of the program counter. A reset initializes this register to 0000H.

• Flag Register

The flag register (F) contains individual flags that are set and reset to represent the status of the result of an 8-bit or 16-bit operation. This register is referenced by extended arithmetic instructions and conditional jump instructions.

Flag Name	Symbol	Function
Sign	S	Bit 7 is set when an operation produces a negative result (MSB = 1) and reset by a positive result (MSB = 0).
Zero	Z	Bit 6 is set when an instruction execution produces a zero result, and reset by any other result.
Half-carry	H	Bit 5 is set when an operation results in a carry or borrow from the 4th bit. The half-carry flag is reset when neither a carry nor borrow is generated. This flag is referenced for adjustment of decimal operations (DAA instruction).
Parity/overflow	P/V	Bit 2 can be used as either a parity or an overflow flag. The parity flag indicates the parity of the data stored in the accumulator following execution of a logical operation. An even number of 1s in the accumulator value sets the parity flag, while an odd number of 1s resets it. The overflow flag is set when the result of a signed arithmetic operation exceeds the range of +127 through -128 for an 8-bit operation, or the range of +32767 through -32768 for a 16-bit operation. Results within these ranges reset the overflow flag.
Negate	N	Bit 1 is set by execution of a subtraction instruction (examples: SUB, DEC, CP) and reset by an addition instruction (examples: ADD, INC).
Carry	C	Bit 0 is set when an operation results in a carry or borrow from the most significant bit. Any other result resets this flag. The following lists the various types of carries and borrows. <ul style="list-style-type: none"> • Carry produced by an addition result • Borrow produced by a subtraction result • Carry produced by a shift or rotate

Addressing Modes

The CPU instruction set has eight addressing modes.

1. Implied Addressing (IMP)

This addressing mode is based on data included within op codes. It is used by instructions that manipulate bit positions specified by the accumulator (A), index registers (IX, IY), stack pointer (SP), HL general-purpose register, or op codes.

2. Register Direct Addressing (REG)

In this addressing mode, 8-bit and 16-bit registers are specified by op code fields g, g', ww, xx, yy, and zz. The following tables show the relationships between field codes and registers.

8-Bit Register Specification

g or g' Field	Specified Register
000	B
001	C
010	D
011	E
100	H
101	L
110	—
111	A

16-bit Register Specification

ww Field	Specified Register
00	BC
01	DE
10	HL
11	SP

xx Field	Specified Register
00	BC
01	DE
10	IX
11	SP

yy Field	Specified Register
00	BC
01	DE
10	IY
11	SP

zz Field	Specified Register
00	BC
01	DE
10	HL
11	AF

3. Register Indirect Addressing (REGI)

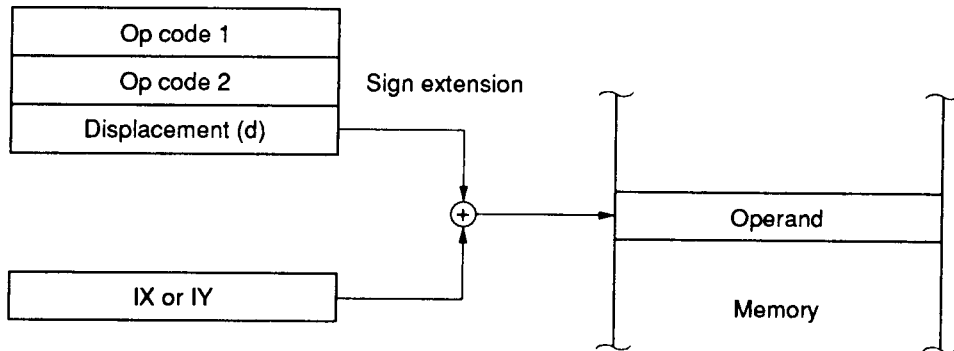

In this addressing mode, general-purpose registers are used as 16-bit address registers for specification of operands in memory.

3

4. Indexed Addressing (INDX)

In this addressing mode, effective addresses are generated by adding a displacement (d: signed 8-bit value) to the index registers (IX, IY).

5. Extended Addressing (EXT)

With this addressing mode, 2 bytes (m, n) following the op code are used as a 16-bit address for direct specification of an operand in memory.

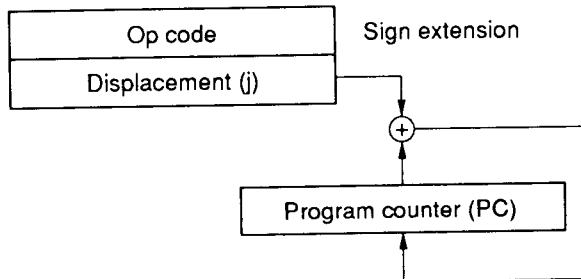

6. Immediate Addressing (IMMED)

With this addressing mode, 1 byte (m) or 2 bytes (m, n) following the op code are used as a direct operand.

7. Relative Addressing (REL)

This addressing mode can be used with branching instructions only. A displacement (j: signed 8-bit value) is added to the program counter (PC) to generate a branch address. In the case of a conditional branch, the branch is taken only when a condition is satisfied.

8. I/O Addressing

This addressing mode can be used with I/O instructions only. The specified address is an I/O address ($\overline{IOE} = 0$). One of the following addresses is output by this addressing mode.

- An address formed by the content of the operand, which is output to A_0 through A_7 , and the content of accumulator A, which is output to A_8 through A_{15} .
- An address formed by the content of register C, which is output to A_0 through A_7 , and the content of register B, which is output to A_8 through A_{15} .
- An address formed by the content of the operand, which is output to A_0 through A_7 , and 00H, which is output to A_8 through A_{15} . This is convenient for accessing on-chip I/O registers.
- An address formed by the content of register C, which is output to A_0 through A_7 , and 00H, which is output to A_8 through A_{15} . This is convenient for accessing on-chip I/O registers.

Instruction Set Overview

The CPU instruction set for this chip can be broken down as follows.

- Operation instructions
- Load instructions
- Program control instructions
- I/O instructions
- Special control instructions

These instructions consist of 1 to 4 bytes. Typical examples are shown below.

3

See Instruction Set Lists for further details.

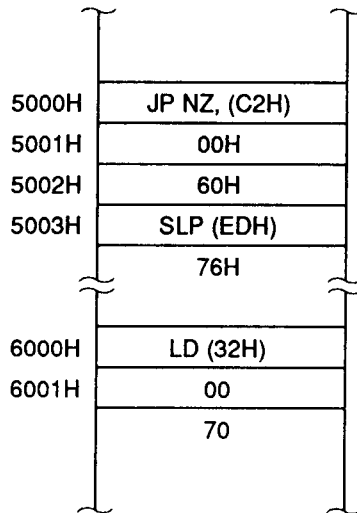

Conditional Jump and Conditional Call Instruction Precautions

The following illustrates operation when the conditional jump instruction JP f, mn is executed. Note the difference in operation when the condition tests true and when it tests false.

Example

When the instruction JP NZ, 6000H is at address 5000H (MMU sets base register to 00H).

Note that when the condition tests false, execution proceeds to the next instruction without reading the 2nd operand of JP f, mn. This is also true in the case of the conditional call: CALL f, mn.

■ Absolute Maximum Ratings

Item	Symbol	Rating	Unit
Analog supply voltage	AV_{CC}	-0.3 to +7.0	V*1
Input voltage (port 4)	V_{in1}	-0.3 to $AV_{CC} + 0.3$	V
Analog input voltage	A_{in}	-0.3 to $AV_{CC} + 0.3$	V
Total current inflow	$\sum I_{OL}$	80	mA*2
Total current outflow	$\sum I_{OH} $	30	mA*3

- Notes:
1. AV_{CC} must equal V_{CC} .
 2. Total current inflow is the total current sunk simultaneously from all input/output lines via output buffers to the HD648180W's V_{SS} .
 3. Total current outflow is the total current sourced simultaneously from the HD648180W's V_{CC} via output buffers to all input/output pins.

■ Electrical Characteristics

DC Characteristics ($V_{CC} = 5\text{ V} \pm 10\%$, $V_{SS} = 0\text{ V}$, $T_a = -20\text{ to } +75^\circ\text{C}$ unless otherwise noted)

Item	Symbol	Test Conditions	Min	Typ	Max	Unit
Input high voltage level for RESET, EXTAL, NMI, STBY	V_{IH1}		$V_{CC} - 0.6$	—	$V_{CC} + 0.3$	V
Input high voltage level for other pins	V_{IH2}		2.0	—	$V_{CC} + 0.3$	V
Input low voltage level for RESET, EXTAL, NMI, STBY	V_{IL1}		-0.3	—	0.6	V
Input low voltage level for other pins	V_{IL2}		-0.3	—	0.8	V
Output high voltage level for all output pins	V_{OH}	$I_{OH} = -200\ \mu\text{A}$	2.4	—	—	V
		$I_{OH} = -20\ \mu\text{A}$	$V_{CC} - 1.2$	—	—	
Output low voltage level for all output pins	V_{OL}	$I_{OL} = 2.2\ \text{mA}$	—	—	0.45	V
Input leakage current for all input pins except XTAL and EXTAL	I_{IL}	$V_{in} = 0.5\text{ to } V_{CC} - 0.5$	—	—	1.0	μA
Tri-state leakage current	I_{TL}	$V_{in} = 0.5\text{ to } V_{CC} - 0.5$	—	—	1.0	μA
Current consumption (normal operation) ^{Note}	I_{CC}	$f = 4\ \text{MHz}$	—	15	30	mA
		$f = 6\ \text{MHz}$	—	20	40	mA
Current consumption (standby mode) ^{Note}	I_{CCSTBY}	—	—	10	20	μA
Pin capacitance	C_p	$V_{in} = 0\ \text{V}$, $f = 1\ \text{MHz}$ $T_a = 25^\circ\text{C}$	—	—	15	pF

Note: Signal levels:

RESET, EXTAL, NMI: $V_{IHmin} = V_{CC} - 0.6\ \text{V}$, $V_{ILmax} = 0.6\ \text{V}$

Other pins: $V_{IHmin} = V_{CC} - 1.0\ \text{V}$, $V_{ILmax} = 0.8\ \text{V}$

All output pins are unloaded.

- DC Characteristics (I/O ports) ($V_{CC}=5V \pm 10\%$, $V_{SS}=0V$, $T_a=-20$ to $+75^\circ C$ unless otherwise noted)

Item		Symbol	Test Conditions	Min	Typ	Max	Unit
Input high voltage	Ports 0 to 4	V_{IHP}		2.0	—	$V_{CC} + 0.3$	V
Input low voltage	Ports 0 to 4	V_{ILP}		-0.3	—	0.8	V
Output high voltage	Ports 0 to 3	V_{OHP}	$I_{OH} = -200 \mu A$	2.4	—	—	V
			$I_{OH} = -20 \mu A$	$V_{CC} - 1.2$	—	—	
Output low voltage	Ports 0 to 3	V_{OLP}	$I_{OL} = 2.2 \text{ mA}$	—	—	0.45	V
	Port 0		$I_{OL} = 10 \text{ mA}$	—	—	1.0	
Input leakage current		$ I_{ILP} $	$V_{in} = 0.5$ to $V_{CC} - 0.5$	—	—	1.0	μA

■ Instruction Set Lists

The following explains the symbols used throughout the instruction set lists contained in this appendix.

1. Register Specification

The register specification symbols are: *g*, *g'*, *ww*, *xx*, *yy*, and *zz*. The symbols *g* and *g'* represent 8-bit registers, while *ww*, *xx*, *yy*, and *zz* represent 16-bit registers, as shown below.

<i>g</i> , <i>g'</i>	Reg.	<i>ww</i>	Reg.	<i>xx</i>	Reg.	<i>yy</i>	Reg.	<i>zz</i>	Reg.
0 0 0	B	0 0	BC	0 0	BC	0 0	BC	0 0	BC
0 0 1	C	0 1	DE	0 1	DE	0 1	DE	0 1	DE
0 1 0	D	1 0	HL	1 0	IX	1 0	IY	1 0	HL
0 1 1	E	1 1	SP	1 1	SP	1 1	SP	1 1	AF
1 0 0	H								
1 0 1	L								
1 1 1	A								

Note: The letters "H" (high) and "L" (low) are appended to the 16-bit register symbols to indicate the upper 8 bits and lower 8 bits. For example: *wwH*, *IXL*.

2. Bit Specification

The symbol *b* in the bit operand of a bit manipulation instruction, specifies the bit location as shown below.

<i>b</i>	Bit
0 0 0	0
0 0 1	1
0 1 0	2
0 1 1	3
1 0 0	4
1 0 1	5
1 1 0	6
1 1 1	7

3. Condition Specification

The symbol *f* specifies the condition against which the result of an operation is compared to determine the next instruction to be executed, as shown below.

<i>f</i>	Condition	
0 0 0	NZ	non zero
0 0 1	Z	zero
0 1 0	NC	non carry
0 1 1	C	carry
1 0 0	PO	parity odd
1 0 1	PE	parity even
1 1 0	P	sign plus
1 1 1	M	sign minus

4. Restart Address

The symbol *v* specifies the restart address for a restart instruction, as shown below.

<i>v</i>	Address
0 0 0	00H
0 0 1	08H
0 1 0	10H
0 1 1	18H
1 0 0	20H
1 0 1	28H
1 1 0	30H
1 1 1	38H

5. Flags

The following symbols are used to denote changes in flags.

- : Flag not affected
- ×: Flag change undefined
- ↑↓: Flag affected according to operation result
- S: Flag set to 1
- R: Flag reset to 0
- P: Flag changes as a parity flag
- V: Flag changes as an overflow flag

6. Other Symbols

()_M: Parentheses contain memory address

()_I: Parentheses contain I/O address

m or n: 8-bit value

mn: 16-bit value

r: r suffix indicates 8-bit register

R: R suffix indicates 16-bit register

b • ()_M: b-th bit of memory address in parentheses

b • gr: b-th bit of general register gr

d or j: Signed 8-bit displacement

S: Source addressing mode

D: Destination addressing mode

•: AND operation

+: OR operation

⊕: XOR operation

• Data Manipulation Instructions

1. Arithmetic and Logical Instructions (8-bit)

First op code

Instruction format: XX

LO		ww (LO = ALL)			g (LO = 0 to 7)							LO = 0 to 7							
		BC	DE	HL	SP	B	D	H	(HL)	1000	1001	1010	1011	BC	DE	HL	AF	zz	
B	0000	0	1	2	3	4	5	6	7					C	D	E	F		
C	0001	NOP DJNZ, JR NZ, JR NC, LD ww, mn																	
D	0010	LD (ww), A LD (mn) LD (mn), HL, A																	
E	0011	INC ww																	
H	0100	INC g																	
L	0101	DEC g																	
(HL)	0110	LD g, m																	
A	0111	RLCA RLA DAA SCF																	
B	1000	EXAF, AF JR i JR Z, j JR C, j																	
C	1001	ADD HL, ww																	
D	1010	LD A, (ww) LD HL, LD A, (mn) (mn)																	
E	1011	DEC ww																	
H	1100	INC g																	
L	1101	DEC g																	
(HL)	1110	LD g, m																	
A	1111	RRCA RRA CPL CGF																	
		0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F		
		C	E	L	A	C	E	L	A					Z	C	PE	M	f	
		g (LO = 8 to F)											LO = 8 to F						
														08H	18H	28H	38H	v	

Notes: 1. g is replaced by (HL).

2. s is replaced by (HL).

3. Appending DD to the beginning of an op code (DD XX) in an instruction that has HL or (HL) in its operand produces the same operation as the original format with the following replacements:

HL replaced by IX

(HL) replaced by (IX + d)

Example:

22H ; LD (mn), HL → DDH 22H ; LD (mn), IX

Similarly, appending FD to the beginning of an op code (FD XX) in an instruction that has HL or (HL) in its operand produces the same operation as the original format with the following replacements:

HL replaced by IY

(HL) replaced by (IY + d)

Example:

34H ; INC (HL) → FDH 34H ; INC (IY + d)

An exception is the JP (HL) instruction (E9H). Appending DDH or FDH to the beginning replaces (HL) with (IX) or (IY). If DDH or FDH is appended to the EX DE, HL instruction (EBH), an undefined instruction results, without replacement of HL.

Table 4 Op Code Map (2)

Second op code

Instruction format: CB XX

		b (LO = 0 to 7)																					
		0		2		4		6		8		10		12		14		16

L	1101	D																					
(HL)	1110	E	Note	Note	Note																		
A	1111	F																					

9 (HI = ALL)

Note: If DDH is appended to the beginning of the op code, the instruction is executed by the op code DD CB d XX, replacing (HL) with (IX + d). Similarly, if FDH is appended to the beginning of the op code, the instruction is executed by the op code FD CB d XX, replacing (HL) with (IY + d).

■ Bus Cycle Conditions

A hyphen in the Address column indicates that address output is undefined. A "Z" in the Data column indicates that the data pin is at high impedance.

■ Acceptable Requests in Each Mode

Action Request	Current Status							
	Normal Mode (CPU Mode) Wait State	Refresh Cycle	Interrupt Acknowledge Cycle	DMA Cycle	Bus Release Mode	Sleep Mode	Standby Mode	
WAIT	Accepted	Accepted	Not accepted	Accepted	Accepted	Not accepted	Not accepted	Not accepted
Refresh request (request for insertion of refresh cycle by on-chip refresh circuit)	Refresh cycle inserted at machine cycle break	Not accepted	Not accepted	Refresh cycle inserted at machine cycle break	Refresh cycle inserted at machine cycle break	Not accepted	Not accepted	Not accepted
DREQ ₀ DREQ ₁	DMA cycle inserted at machine cycle break	Accepted, but DMA cycle not inserted until machine cycle break	Accepted * Following completion of refresh cycle, 1 machine cycle is executed and then DMA cycle is inserted.	DMA cycle inserted at machine cycle break	Accepted (Consult this manual for full details.)	Accepted * Following completion of bus release cycle, 1 machine cycle is executed and then DMA cycle is inserted.	Not accepted	Not accepted
BUSREQ	Bus release mode entered at machine cycle break	Not accepted	Not accepted	Bus release mode entered at machine cycle break	Bus release mode entered at machine cycle break	Bus release mode continues	Accepted	Accepted

Note: * Not accepted when DREQ₀ and DREQ₁ are set for level detection.

Current Status

Action Request	Normal Mode (CPU Mode) (IOSTOP Mode)	Wait State	Refresh Cycle	Interrupt Acknowledge Cycle	DMA Cycle	Bus Release Mode	Sleep Mode	Standby Mode
Interrupts \overline{INT}_0 , \overline{INT}_1 , \overline{INT}_2	Accepted in final machine cycle of instruction	Accepted in final machine cycle of instruction	Not accepted	Not accepted	Not accepted	Not accepted	Accepted, sleep mode exited and normal status recovered	Not accepted
Internal I/O interrupt request	Accepted in final machine cycle of instruction	Accepted in final machine cycle of instruction	Not accepted	Not accepted	Not accepted	Not accepted	Accepted, sleep mode exited and normal status recovered	Not accepted
NMI	Accepted in final machine cycle of instruction	Accepted in final machine cycle of instruction	Not accepted	Not accepted **Accepted in final machine cycle of instruction following completion of acknowledge cycle.	Accepted, DMA suspended	Not accepted	Accepted, sleep mode exited and normal status recovered	Accepted, standby mode exited and normal status recovered. Note that IOSTOP bit remains set to 1.

Note: ** Accepted when \overline{INT}_0 is being used in mode 0. The NMI acknowledge cycle begins following execution of the instruction placed on the bus.

■ Request Priority Sequence

Three types of requests can be input to the CPU.

1. Requests that can be accepted and executed at the end of a state (WAIT)
2. Requests that can be accepted and executed at the end of a machine cycle (refresh requests, DMA requests, $\overline{\text{BUSREQ}}$)
3. Requests that can be accepted and executed at the end of an instruction (all interrupts)

Basically, the priority sequence gives 1 the highest priority, and 3 the lowest.

Within group 2 above, the descending priority sequence is:

$\overline{\text{BUSREQ}}$

Refresh request

DMA request

If a $\overline{\text{BUSREQ}}$ and refresh request are input simultaneously, the $\overline{\text{BUSREQ}}$ is given priority.

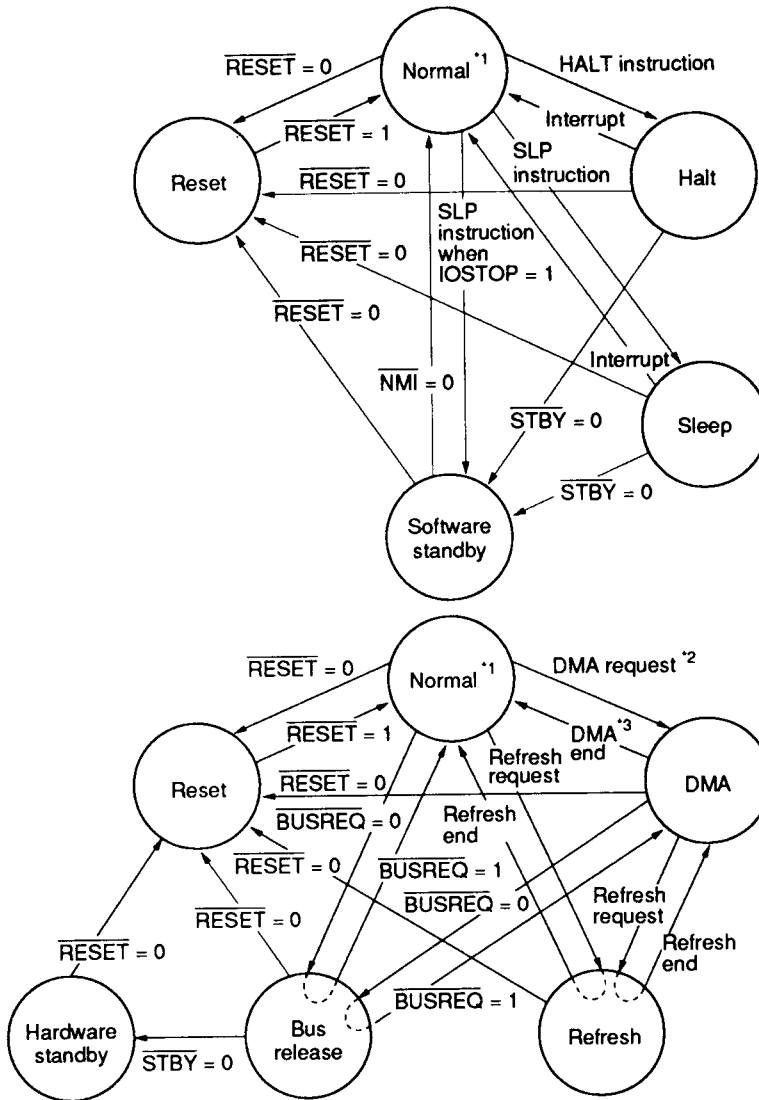

For the priority sequence of the interrupts in group 3 above, see the section of this manual that details interrupt operations.

4. Among requests that are accepted and executed in the final machine cycle of an instruction, the descending priority sequence is:

Bus requests ($\overline{\text{BUSREQ}}$, refresh request, DMA request)

Interrupt

■ Mode Transitions

3

- Notes:
1. Normal: Normal CPU instruction execution mode
 2. DMA request: $\overline{\text{DREQ}}_0$ or $\overline{\text{DREQ}}_1 = 0$ (for memory ↔ (memory-mapped) I/O transfers)
 $\text{DE0} = 1$ (for Memory ↔ Memory transfers)
 3. DMA end: $\overline{\text{DREQ}}_0$ or $\overline{\text{DREQ}}_1 = 1$ (for memory ↔ (memory-mapped) I/O transfers)
 BCR0 and $\text{BCR1} = 0000\text{H}$ (for all transfer modes)
 $\overline{\text{NMI}} = 0$ (for all transfer modes)

In addition to the above, the following mode transitions are also possible.

1. From halt to DMA, refresh, or bus release, and vice versa.
2. From sleep to bus release, and vice versa.

■ Status Signal List

The following list shows the status signal output for each mode.

Mode		LIR	ME	IOE	RD	WR	REF	HALT	BUSACK	ST	Address Bus	Data Bus
CPU operation	1st op code fetch	0	0	1	0	1	1	1	1	0	A	In
	Other op code fetch	0	0	1	0	1	1	1	1	1	A	In
	Memory read	1	0	1	0	1	1	1	1	1	A	In
	Memory write	1	0	1	1	0	1	1	1	1	A	Out
	I/O read	1	1	0	0	1	1	1	1	1	A	In
	I/O write	1	1	0	1	0	1	1	1	1	A	Out
	Internal operation	1	1	1	1	1	1	1	1	1	A	In
Refresh		1	0	1	1	1	0	1	1	*	A	In
Interrupt acknowledge (1st machine cycle)	$\overline{\text{NMI}}$	0	0	1	0	1	1	1	1	0	A	In
	$\overline{\text{INT}}_0$	0	1	0	1	1	1	1	1	0	A	In
	$\overline{\text{INT}}_1, \overline{\text{INT}}_2$, and internal interrupts	1	1	1	1	1	1	1	1	0	A	In
Bus release		1	Z	Z	Z	Z	1	1	0	*	Z	In
Halt		0	0	1	0	1	1	0	1	0	A	In
Sleep		1	1	1	1	1	1	0	1	1	1	In
Internal DMA	Memory read	1	0	1	0	1	1	*	1	0	A	In
	Memory write	1	0	1	1	0	1	*	1	0	A	Out
	I/O read	1	1	0	0	1	1	*	1	0	A	In
	I/O write	1	1	0	1	0	1	1	1	0	A	Out
Reset	1	1	1	1	1	1	1	1	1	1	Z	In

1 = high level; 0 = low level; * = undefined; A = any value; Z = high impedance; IN = input; OUT = output

Internal I/O Register Reference

The upper 8 bits of the I/O register address are all 0. The most significant bit of the lower 8 bits can be set using the IOA7 bit of the IO control register. The table below shows the addresses when IOA7 = 0.
