

## Features

- This Circuit is Processed in Accordance to MIL-STD-883 and is Fully Conformant Under the Provisions of Paragraph 1.2.1.
- Low Power Standby . . . . . 275µW Max
- Low Power Operation . . . . . .55mW/MHz Max
- Fast Access Time . . . . . 120/200ns Max
- Industry Standard Pinout
- Single Supply . . . . . 5.0V VCC
- TTL Compatible
- Static Memory Cells
- High Output Drive
- On-Chip Address Latches
- Easy Microprocessor Interfacing

## Description

The HM-6516/883 is a CMOS 2048 x 8 Static Random Access Memory. Extremely low power operation is achieved by the use of complementary MOS design techniques. This low power is further enhanced by the use of synchronous circuit techniques that keep the active (operating) power low, which also gives fast access times. The pinout of the HM-6516/883 is the popular 24 pin, 8-bit wide JEDEC Standard which allows easy memory board layouts, flexible enough to accommodate a variety of PROMs, RAMS, EPROMs, and ROMs.

The HM-6516/883 is ideally suited for use in microprocessor based systems. The byte wide organization simplifies the memory array design, and keeps operating power down to a minimum because only one device is enabled at a time. The address latches allow very simple interfacing to recent generation microprocessors which employ a multiplexed address/data bus. The convenient output enable control also simplifies multiplexed bus interfacing by allowing the data outputs to be controlled independent of the chip enable.

## Ordering Information

## Absolute Maximum Ratings

Supply Voltage ..... +7.0V  
 Input or Output Voltage Applied for all Grades. .... GND -0.3V to VCC +0.3V  
 ESD Classification ..... Class 1

## Thermal Information

Thermal Resistance  $\theta_{JA}$   $\theta_{JC}$   
 CERDIP Package ..... 48°C/W 8°C/W  
 CLCC Package ..... 66°C/W 12°C/W  
 Maximum Storage Temperature Range ..... -65°C to +150°C  
 Maximum Junction Temperature. .... +175°C  
 Maximum Lead Temperature (Soldering 10s). .... +300°C

## Die Characteristics

Gate Count ..... 25953 Gates

*CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.*

## Operating Conditions

Operating Voltage Range. .... +4.5V to +5.5V Input High Voltage. .... +2.4V to VCC  
 Operating Temperature Range. .... -55°C to +125°C Data Retention Supply Voltage. .... 2.0V to 4.5V  
 Input Low Voltage. .... 0V to +0.8V Input Rise and Fall Time ..... 40ns Max

Timing Waveforms

FIGURE 1. READ CYCLE

The address information is latched in the on-chip registers on the falling edge of  $\bar{E}$  ( $T = 0$ ), minimum address setup and hold time requirements must be met. After the required hold time, the addresses may change state without affecting device operation. During time ( $T = 1$ ), the outputs become enabled but data is not valid until time ( $T = 2$ ),  $\bar{W}$  must remain high throughout

the read cycle. After the data has been read,  $\bar{E}$  may return high ( $T = 3$ ). This will force the output buffers into a high impedance mode at time ( $T = 4$ ).  $\bar{G}$  is used to disable the output buffers when in a logical "1" state ( $T = -1, 0, 3, 4, 5$ ). After ( $T = 4$ ) time, the memory is ready for the next cycle.

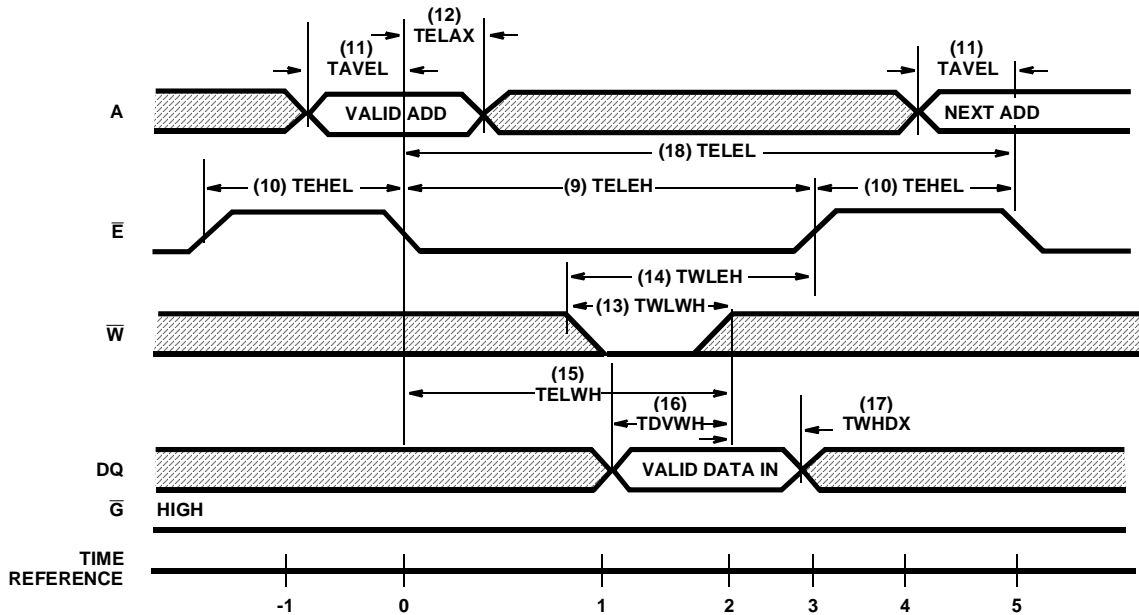

FIGURE 2. WRITE CYCLE

The write cycle is initiated on the falling edge of  $\bar{E}$  ( $T = 0$ ), which latches the address information in the on-chip registers. If a write cycle is to be performed where the output is not to become active,  $\bar{G}$  can be held high (inactive). TDVWH and TWHDX must be met for proper device operation regardless of  $\bar{G}$ . If  $\bar{E}$  and  $\bar{G}$  fall before  $\bar{W}$  falls (read mode), a possible bus conflict may exist. If  $\bar{E}$  rises before  $\bar{W}$  rises, reference data

setup and hold times to the  $\bar{E}$  rising edge. The write operation is terminated by the first rising edge of  $\bar{W}$  ( $T = 2$ ) or  $E$  ( $T = 3$ ). After the minimum  $\bar{E}$  high time (TEHEL), the next cycle may begin. If a series of consecutive write cycles are to be performed, the  $\bar{W}$  line may be held low until all desired locations have been written. In this case, data setup and hold times must be referenced to the rising of  $\bar{E}$ .
