

1-Axis Magnetic Sensor HMC1041Z

Advanced Information

The Honeywell HMC1041Z is a z-axis surface mount option designed for low field magnetic sensing. By adding the HMC1041Z to other 2-axis magneto-resistive sensors, a cost effective and space-efficient 3-axis magnetometer or compassing solution is enabled. This compact, low cost solution is easy to assemble for high volume, cost effective OEM designs. Applications for the HMC1041Z include Compassing, Navigation Systems, Magnetometry, and Current Sensing.

The HMC1041Z utilizes Honeywell's Anisotropic Magneto-resistive (AMR) technology that provides advantages over coil based magnetic sensors. They are extremely sensitive, low field, solid-state magnetic sensors designed to measure direction and magnitude of Earth's magnetic fields, from tens of micro-gauss to 6 gauss. Honeywell's Magnetic Sensors are among the most sensitive and reliable low-field sensors in the industry.

Honeywell continues to maintain product excellence and performance by introducing innovative solid-state magnetic sensor solutions. These are highly reliable, top performance products that are delivered when promised. Honeywell's magnetic sensor solutions provide real solutions you can count on.

FEATURES

- ▶ Low Height Magnetic Sensors (1.05mm)
- ▶ Surface Mount Z-Axis Sensor
- ▶ Low Voltage Operations (2.0V)
- ▶ Low Cost
- ▶ Available in Tape & Reel Packaging
- ▶ Lead Free Package Construction
- ▶ 4-Element Wheatstone Bridge
- ▶ Wide Magnetic Field Range (+/-6 Oe)
- ▶ Patented Offset and Set/Reset Straps

BENEFITS

- ▶ Narrow Dimensions and Small Size for Low Profile Vertical Sensing Applications and Mounting, No Layout Constraints
- ▶ Easy to Assemble & Compatible with High Speed SMT Assembly
- ▶ Compatible for Battery Powered Applications
- ▶ Designed for High Volume, Cost Effective OEM Designs
- ▶ High Volume OEM Assembly
- ▶ Complies with Current Environmental Standards
- ▶ Low Noise Passive Element Design
- ▶ Sensor Can Be Used in Strong Magnetic Field Environments
- ▶ Stray Magnetic Field Compensation

SPECIFICATIONS

| Characteristics | Conditions* | Min | Typ | Max | Units |
|------------------------|--|-------|----------------------|-------|--|
| Bridge Elements | | | | | |
| Supply | Vbridge referenced to GND | 2.0 | 5.0 | 20 | Volts |
| Resistance | Bridge current = 1mA | 800 | 1050 | 1300 | ohms |
| Field Range | Full scale (FS) – total applied field | -6 | | +6 | gauss |
| Sensitivity | Set/Reset Current = 0.5A | 0.8 | 1.0 | 1.25 | mV/V/gauss |
| Resolution | 1 kHz bandwidth, Vbridge = 5.0 volts | | 0.16 1.44 | | milli-gauss (RMS) milli-gauss (pk – pk) |
| Bridge Offset | Offset = (OUT+) – (OUT-) Field = 0 gauss after Set pulse | -2.0 | ±0.5 | +2.0 | mV/V |
| Bandwidth | Magnetic signal (lower limit = DC) | | 5 | | MHz |
| Disturbing Field | Sensitivity starts to degrade. Use S/R pulse to restore sensitivity. | | | 20 | gauss |
| Max. Exposed Field | No perming effect on zero reading | | | 10000 | gauss |
| Operating Temperature | Ambient | -40 | | 125 | °C |
| Storage Temperature | Ambient, unbiased | -55 | | 125 | °C |
| Sensitivity Tempco | T _A = -40 to 125°C, Vbridge=5V | -3500 | -3100 | -2000 | ppm/°C |
| Bridge Offset Tempco | T _A = -40 to 125°C, No Set/Reset T _A = -40 to 125°C, With Set/Reset | | ±500 ±10 | | ppm/°C |
| Bridge Ohmic Tempco | Vbridge=5V, T _A = -40 to 125°C | 2100 | 2500 | 2900 | ppm/°C |
| Cross-Axis Sensitivity | Cross field = 0.5 gauss, Happlied = ±3 gauss | | ±0.5% | | %FS/gauss |
| Linearity Error | Best fit straight line ± 1 gauss ± 3 gauss ± 6 gauss | | 0.17 0.42 0.80 | | %FS |
| Hysteresis Error | 3 sweeps across ±3 gauss | | 0.15 | | %FS |
| Repeatability Error | 3 sweeps across ±3 gauss | | 0.11 | | %FS |
| Weight | | | 8.9 | | milli-grams |

* Tested at 25°C except stated otherwise.

SPECIFICATIONS

| Characteristics | Conditions* | Min | Typ | Max | Units |
|------------------------|--|------|------|------|--------|
| Set/Reset Strap | | | | | |
| Resistance | Measured from S/R+ to S/R- | 3 | 5 | 6 | ohms |
| Current | 0.1% duty cycle, or less, 2 μ sec current pulse | 0.4 | 0.5 | 2 | Amp |

| A | 0.91 | 1.08 | 1.25 |
| b | 0.17 | 0.20 | 0.23 |
| L | 0.37 | 0.40 | 0.43 |
| e | 0.5 basic | | |

Mounting Considerations

The following is the recommend printed circuit board (PCB) footprint for the HMC1041Z. The two small (0.5mm by 0.5mm) leveling pads are to hold the part square to the PCB and should receive the same pad finish as the rest of the pads but without additional solder paste. The goal is to hold the part vertical surfaces perpendicular to the board surface. All dimensions are nominal and in millimeters.

Stencil Design and Solder Paste

A 4 mil stencil and 100% paste coverage is recommended for the eight electrical contact pads. Do not apply paste on the leveling pads. The HMC1041Z has been tested successfully with no-clean solder paste.

Pick and Place

Placement is machine dependant and no restrictions are recommended, and have be tested with mechanical centering. Placement force should be equivalent 1206 SMT resistors and enough force should be used to squeeze the paste out from the package/contact pad overlap and to keep the package pin contacts vertical. The low mass of the HMC1041Z ensures that very little paste is required to hold the part until reflow.

Reflow and Rework

No special profile is required for the HMC1041Z, and compatible with lead eutectic and lead-free solder paste reflow profiles. Honeywell recommends the adherence to solder paste manufacturer's guidelines. The HMC1041Z may be reworked with soldering irons, but extreme care must be taken not to overheat the copper pads from the part's fiberglass substrate. Irons with a tip temperature no greater than 315°C should be used. Excessive rework risks the copper pads pulling away into the molten solder.

Basic Device Operation

The Honeywell HMC1041Z magnetoresistive sensor is a Wheatstone bridge device to measure magnetic fields. With power supply applied to a bridge, the sensor converts any incident magnetic field in the sensitive axis direction to a differential voltage output. In addition to the bridge circuit, the sensor has two on-chip magnetically coupled straps; the offset strap and the set/reset strap. These straps are Honeywell patented features for incident field adjustment and magnetic domain alignment; and eliminate the need for external coils positioned around the sensors.

The magnetoresistive sensors are made of a nickel-iron (Permalloy) thin-film deposited on a silicon wafer and patterned as a resistive strip element. In the presence of a magnetic field, a change in the bridge resistive elements causes a corresponding change in voltage across the bridge outputs.

These resistive elements are aligned together to have a common sensitive axis (indicated by arrows on the pinouts) that will provide positive voltage change with magnetic fields increasing in the sensitive direction. Because the output only is in proportion to the one-dimensional axis (the principle of anisotropy) and its magnitude, additional sensor bridges placed at orthogonal directions permit accurate measurement of arbitrary field direction. The combination of sensor bridges in two and three orthogonal axis permit applications such as compassing and magnetometry.

The offset strap allows for several modes of operation when a direct current is driven through it. These modes are: 1) Subtraction (bucking) of an unwanted external magnetic field, 2) null-ing of the bridge offset voltage, 3) Closed loop field cancellation, and 4) Auto-calibration of bridge gain.

The set/reset strap can be pulsed with high currents for the following benefits: 1) Enable the sensor to perform high sensitivity measurements, 2) Flip the polarity of the bridge output voltage, and 3) Periodically used to improve linearity, lower cross-axis effects, and temperature effects.

Offset Strap

The offset strap is a spiral of metallization that couples in the sensor element's sensitive axis. The offset strap measures nominally 8 ohms, and requires 10mA for each gauss of induced field. The straps will easily handle currents to buck or boost fields through the ± 6 gauss linear measurement range, but designers should note the extreme thermal heating on the die when doing so.

With most applications, the offset strap is not utilized and can be ignored. Designers can leave one or both strap connections (Off- and Off+) open circuited, or ground one connection node. Do not tie both strap connections together to avoid shorted turn magnetic circuits.

Set/Reset Strap

The set/reset strap is another spiral of metallization that couples to the sensor elements easy axis (perpendicular to the sensitive axis on the sensor die. Each set/reset strap has a nominal resistance of 5 ohms with a nominal required peak

current of 500mA for reset or set pulses. With rare exception, the set/reset strap must be used to periodically condition the magnetic domains of the magneto-resistive elements for best and reliable performance.

A set pulse is defined as a positive pulse current entering the S/R+ strap connection. The successful result would be the magnetic domains aligned in a forward easy-axis direction so that the sensor bridge's polarity is a positive slope with positive fields on the sensitive axis result in positive voltages across the bridge output connections.

A reset pulse is defined as a negative pulse current entering the S/R+ strap connection. The successful result would be the magnetic domains aligned in a reverse easy-axis direction so that sensor bridge's polarity is a negative slope with positive fields on the sensitive axis result in negative voltages across the bridge output connections.

Typically a reset pulse is sent first, followed by a set pulse a few milliseconds later. By shoving the magnetic domains in completely opposite directions, any prior magnetic disturbances are likely to be completely erased by the duet of pulses. For simpler circuits with less critical requirements for noise and accuracy, a single polarity pulse circuit may be employed (all sets or all resets). With these uni-polar pulses, several pulses together become close in performance to a set/reset pulse circuit. Figure 1 shows a quick and dirty manual pulse circuit for uni-polar application of pulses to the set/reset strap.
