

0.5 dB LSB GaAs MMIC 6-BIT DIGITAL VARIABLE GAIN AMPLIFIER w/ SERIAL CONTROL, DC - 1 GHz

Typical Applications

The HMC681ALP5E is ideal for:

- IF & RF Applications
- Cellular/3G Infrastructure
- WiBro / WiMAX / 4G
- Microwave Radio & VSAT
- Test Equipment and Sensors

Functional Diagram

Features

- +13.5 dB to +45 dB Gain Control in 0.5 dB Steps
- High Output IP3: +36 dBm
- ±0.25 dB Typical Gain Step Error
- Single +5V Supply
- 32 Lead 5x5 mm SMT Package: 25 mm²

General Description

The HMC681ALP5E is a digitally controlled variable gain amplifier which operates from DC to 1 GHz, and can be programmed to provide anywhere from 13.5 dB, to 45 dB of gain, in 0.5 dB steps. The HMC681ALP5E delivers noise figure of 2.8 dB in its maximum gain state, with output IP3 of up to +36 dBm in any state. This serially controlled digital VGA incorporates off chip AC ground capacitors for near DC operation, making it suitable for a wide variety of RF and IF applications. The HMC681ALP5E is housed in a RoHS compliant 5x5 mm QFN leadless package, and provides the user with a highly integrated solution. This functionality is also available with parallel control as the HMC626ALP5E.

Power-Up States

If LE is set to logic LOW at power-up, the logic state of PUP1 and PUP2 determines the power-up state of the part per PUP truth table. The attenuator latches in the desired power-up state approximately 200 ms after power-up.

Power-On Sequence

The ideal power-up sequence is: GND, Vdd, digital inputs, RF inputs. The relative order of the digital inputs are not important as long as they are powered after Vdd / GND

PUP Truth Table

| LE | PUP1 | PUP2 | Relative Gain Setting |
|----|------|------|-----------------------|
| 0 | 0 | 0 | -31.5 |
| 0 | 1 | 0 | -24 |
| 0 | 0 | 1 | -16 |

0.5 dB LSB GaAs MMIC 6-BIT DIGITAL VARIABLE GAIN AMPLIFIER w/ SERIAL CONTROL, DC - 1 GHz

Serial Control Interface

The HMC681ALP5E contains a 3-wire SPI compatible digital interface (SERIN, CLK, LE). It is activated when P/S is kept high. The 6-bit serial word must be loaded MSB first. The positive-edge sensitive CLK and LE requires clean transitions. If mechanical switches were used, sufficient debouncing should be provided. When LE is high, 6-bit data in the serial input register is transferred to the attenuator. When LE is high CLK is masked to prevent data transition during output loading.

For all modes of operations, gain will remain constant while LE is kept low.

Truth Table

| Parameter | Typ. |
|---|--------|
| Min. serial period, t_{SCK} | 100 ns |
| Control set-up time, t_{CS} | 20 ns |
| Control hold-time, t_{CH} | 20 ns |
| LE setup-time, t_{LN} | 10 ns |
| Min. LE pulse width, t_{LEW} | 10 ns |
| Min LE pulse spacing, t_{LES} | 630 ns |
| Serial clock hold-time from LE, t_{CKN} | 10 ns |
| Hold Time, t_{PH} | 0 ns |
| Latch Enable Minimum Width, t_{LEN} | 10 ns |
| Setup Time, t_{PS} | 2 ns |

| Serial Word | | | | | | Relative Gain Setting |
|-------------|------------|------------|------------|------------|--------------|-----------------------|
| B5 16 dB | B4 8 dB | B3 4 dB | B2 2 dB | B1 1 dB | B0 0.5 dB | |
| High | High | High | High | High | High | Reference 0 dB |
| High | High | High | High | High | Low | -0.5 dB |
| High | High | High | High | Low | High | -1 dB |
| High | High | High | Low | High | High | -2 dB |
| High | High | Low | High | High | High | -4 dB |
| High | Low | High | High | High | High | -8 dB |
| Low | High | High | High | High | High | -16 dB |
| Low | Low | Low | Low | Low | Low | -31.5 dB |

Any combination of the above states will provide a relative gain setting approximately equal to the sum of the bits selected.

Pin Descriptions

| Pin Number | Function | Description | Interface Schematic |
|------------------------------------|--|--|---|
| 1, 5, 9, 14, 16, 23, 28 | N/C | The pins are not connected internally; however, all data shown herein was measured with these pins connected to RF/DC ground externally. | |
| 2, 20 | RFin1,RFin2 | This pin is DC coupled. An off chip DC blocking capacitor is required. |  |
| 4, 22 | RFout1, RFout2 | RF output and DC bias (Vcc) for the output stage of the amplifiers. Amplifier bias provided via external bias tee as shown in application circuit. |  |
| 3, 7, 18, 21 | GND | These pins and package bottom must be connected to RF/DC ground. |  |
| 6, 19 | ATTin, ATTout | These pins are DC coupled and matched to 50 Ohms. Blocking capacitors are required. Select value based on lowest frequency of operation. |  |
| 8, 10, 11, 12, 13, 15, 17 | ACG1, ACG2, ACG3, ACG4, ACG5, ACG6, ACG7 | External capacitors to ground is required. Select value for lowest frequency of operation. Place capacitor as close to pins as possible. | |

[2] Circuit Board Material: Arlon 25FR

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request. Refer to "Components for Selected Frequencies" table for part number.
