

FEATURES

Nonreflective, 50 Ω design

High isolation: 60 dB typical

Low insertion loss: 0.8 dB typical

High power handling

34 dBm through path

29 dBm terminated path

High linearity

0.1 dB compression (P0.1dB): 35 dBm typical

Input third-order intercept (IP3): 60 dBm typical

ESD ratings

4 kV human body model (HBM), Class 3A

1.25 kV charged device model (CDM)

Single positive supply

3.3 V to 5 V

1.8 V-compatible control

All off state control

16-lead, 4 mm \times 4 mm LFCSP (16 mm²)

Pin compatible with the [HMC849ALP4CE](#)

APPLICATIONS

Cellular/4G infrastructure

Wireless infrastructure

Automotive telematics

Mobile radios

Test equipment

GENERAL DESCRIPTION

The [HMC8038](#) is a high isolation, nonreflective, 0.1 GHz to 6.0 GHz, silicon, single-pole, double-throw (SPDT) switch in a leadless, surface-mount package. The switch is ideal for cellular infrastructure applications, yielding up to 62 dB of isolation up to 4.0 GHz, a low 0.8 dB of insertion loss up to 4.0 GHz, and 60 dBm of input third-order intercept. Power handling is excellent up to 6.0 GHz, and it offers an input power for an 0.1 dB compression point (P0.1dB) of 35 dBm ($V_{DD} = 5$ V). On-chip circuitry operates a single, positive supply voltage from 3.3 V to 5 V, as well as a

single, positive voltage control from 0 V to 1.8 V/3.3 V/5.0 V at very low dc currents. An enable input (EN) set to logic high places the switch in an all off state, in which RFC is reflective.

The [HMC8038](#) has ESD protection on all device pins, including the RF interface, and can stand 4 kV HMB and 1.25 kV CDM. The [HMC8038](#) offers very fast switching and RF settling times of 150 ns and 170 ns, respectively. The device comes in a RoHS-compliant, compact 4 mm \times 4 mm LFCSP.

Control Voltage Range (V_{CTL} , EN)	-0.5 V to $V_{DD} + (+0.5 V)$
RF Input Power ¹ (see Figure 2)	
Through Path	35 dBm
Terminated Path	30 dBm
Hot Switching	30 dBm
Channel Temperature	135°C
Storage Temperature Range	-65°C to +150°C
Thermal Resistance (Channel to Package Bottom)	
Through Path	110°C/W
Terminated Path	100°C/W
ESD Sensitivity	
HBM	4 kV (Class 3A)
CDM	1.25 kV

¹ For recommended operating conditions, see Table 1.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

During the through mode of operation, the supply voltage scales the maximum allowed input power. The power handling vs. frequency for the 3.3 V and 5 V supplies is shown in Figure 2.

Figure 2. Through Path, Power Handling vs. Frequency

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

- NOTES**
1. NC = NO CONNECT. THE PINS ARE NOT CONNECTED INTERNALLY; HOWEVER, ALL DATA SHOWN HEREIN WAS MEASURED WITH THESE PINS CONNECTED TO RF/DC GROUND EXTERNALLY.
 2. EXPOSED PAD. EXPOSED PAD MUST BE CONNECTED TO RF/DC GROUND.

Figure 3. Pin Configuration

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	V _{DD}	Supply Voltage Pin.
2	V _{CTL}	Control Input Pin. See Figure 5 for the V _{CTL} interface schematic. Refer to Table 6 and the recommended input control voltage range in Table 2.
3	RFC	RF Common Port. This pin is dc-coupled and matched to 50 Ω. A dc blocking capacitor is required on this pin.
4, 6 to 8, 13 to 16	NC	Not Internally Connected. These pins are not internally connected; however, all data shown in this data sheet is measured with the NC pins externally connected to RF/dc ground on the evaluation board.
5	EN	Enable Input Pin. See Figure 5 for the EN interface schematic. Refer to Table 6 and the recommended input control voltage range in Table 2.
9	RF1	RF Port 1. This pin is dc-coupled and matched to 50 Ω. A dc blocking capacitor is required on this pin.
10, 11	GND	Ground. The package bottom has an exposed metal pad that must connect to the printed circuit board (PCB) RF ground. See Figure 4 for the GND interface schematic.
12	RF2	RF Port 2. This pin is dc-coupled and matched to 50 Ω. A dc blocking capacitor is required on this pin.
	EPAD	Exposed Pad. Exposed pad must be connected to RF/dc ground.

THEORY OF OPERATION

The [HMC8038](#) requires a single-supply voltage applied to the V_{DD} pin. Bypassing capacitors are recommended on the supply line to minimize RF coupling.

The [HMC8038](#) is controlled via two digital control voltages applied to the V_{CTL} pin and the EN pin. A small bypassing capacitor is recommended on these digital signal lines to improve the RF signal isolation.

The [HMC8038](#) is internally matched to $50\ \Omega$ at the RF input port (RFC) and the RF output ports (RF1 and RF2); therefore, no external matching components are required. The RFx pins are dc-coupled, and dc blocking capacitors are required on the RF lines. The design is bidirectional; the input and outputs are interchangeable.

The ideal power-up sequence is as follows:

1. Power up GND.
2. Power up V_{DD} .
3. Power up the digital control inputs. The relative order of the logic control inputs are not important. Powering the digital control inputs before the V_{DD} supply can inadvertently forward bias and damage ESD protection structures.
4. Power up the RF input.

With the EN pin is logic low, the [HMC8038](#) has two operation modes: on and off. Depending on the logic level applied to the V_{CTL} pin, one RF output port (for example, RF1) is set to on mode, by which an insertion loss path is provided from the input to the output, as the other RF output port (for example, RF2) is set to off mode, by which the output is isolated from the input. When the RF output port (RF1 or RF2) is in isolation mode, internally terminate it to $50\ \Omega$, and the port absorbs the applied RF signal.

When the EN pin is logic high, the EN pin sets the [HMC8038](#) switch to off mode. In off mode, both output ports are isolated from the input, and the RFC port is open reflective.

Table 7. Switch Operation Mode

Digital Control Inputs		Switch Mode	
V_{EN}	V_{CTL}	RFC to RF1	RFC to RF2
0	0	Off mode. The RF1 port is isolated from the RFC port and is internally terminated to a $50\ \Omega$ load to absorb the applied RF signals.	On mode. A low insertion loss path from the RFC port to the RF2 port.
0	1	On mode. A low insertion loss path from the RFC port to the RF1 port.	Off mode. The RF2 port is isolated from the RFC port and is internally terminated to a $50\ \Omega$ load to absorb the applied RF signals.
1	X ¹	All in off mode. Both the RF1 and RF2 ports are isolated from the RFC port, and the RFC port is reflective.	

¹ X stands for don't care.

APPLICATIONS INFORMATION

Generate the evaluation PCB used in the application shown in Figure 17 with proper RF circuit design techniques. Signal lines at the RF port must have a 50 Ω impedance, and the package ground leads and backside ground slug must connect directly to the ground plane, as shown in Figure 18. The evaluation board shown in Figure 18 is available from Analog Devices, Inc. upon request.
