

64Mbyte (16Mx36) EDO/with Parity Mode 4K Ref. 72pin-SIMM Design
Part No. HMD16M36M12EG

GENERAL DESCRIPTION

The HMD16M36M12EG is a 16M x 36bit dynamic RAM high-density memory module. The module consists of eight CMOS 16M x 4bit DRAMs in 32-pin SOJ or TSOP packages and four CMOS 16Mx1bit DRAMs in SOJ or TSOP packages mounted on a 72-pin glass-epoxy substrate. A 0.1 or 0.22uF decoupling capacitor is mounted on the printed circuit board for each DRAM components. The module is a Single In-line Memory Module with edge connections and is intended for mounting in to 72-pin edge connector sockets. All module components may be powered from a single 5V DC power supply and all inputs and outputs are TTL-compatible.

NOTES

1. An initial pause of 200 μ s is required after power-up followed by any 8 /RAS-only or /CAS-before-/RAS refresh cycles before proper device operation is achieved.
2. $V_{IH(min)}$ and $V_{IL(max)}$ are reference levels for measuring timing of input signals. Transition times are measured between $V_{IH(min)}$ and $V_{IL(max)}$ and are assumed to be 5ns for all inputs.
3. Measured with a load equivalent to 2TTL loads and 100pF
4. Operation within the $t_{RCD(max)}$ limit insures that $t_{RAC(max)}$ can be met. $t_{RCD(max)}$ is specified as a reference point only. If t_{RCD}

is greater than the specified $t_{RCD(max)}$ limit, then access time is controlled exclusively by t_{CAC} .

5. Assumes that $t_{RCD} \geq t_{RCD(max)}$

6. t_{AR} , t_{WCR} , t_{DHR} are referenced to $t_{RAD(max)}$

7. This parameter defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL} .

8. t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are non restrictive operating parameter.

They are included in the data sheet as electrical characteristic only. If $t_{WCS} \geq t_{WCS(min)}$ the cycle is an early write cycle and the data out pin will remain high impedance for the duration of the cycle.

9. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.

10. These parameters are referenced to the /CAS leading edge in early write cycles and to the /W leading edge in read-write cycles.

11. Operation within the $t_{RAD(max)}$ limit insures that $t_{RAC(max)}$ can be met. $t_{RAD(max)}$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD(max)}$ limit, then access time is controlled by t_{AA} .
